Activity-Based Models

1993-2012

- Early history in the U.S.
- Basics of the “Activity-Based” model systems
- Advanced features

The Day Activity Schedule (TRB January 1994)

Discrete Choice Approaches

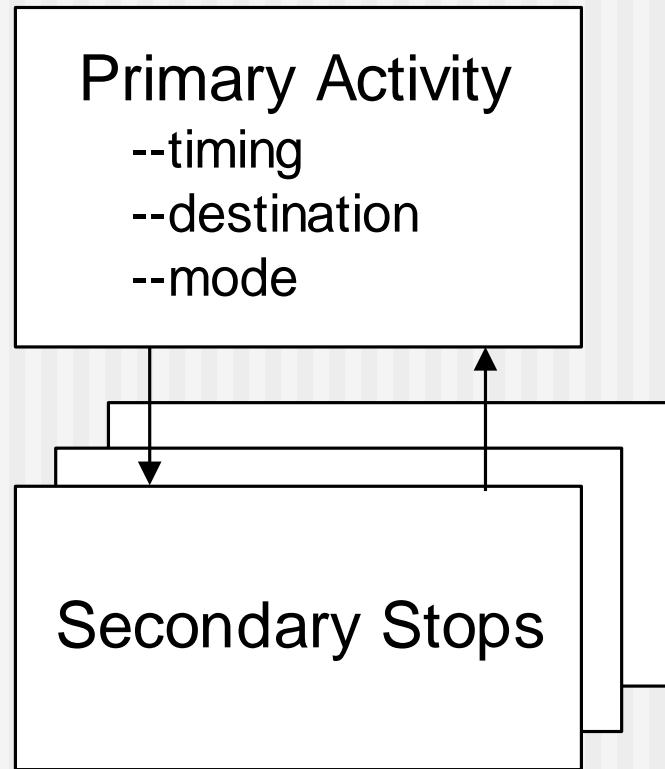

Day Activity Pattern

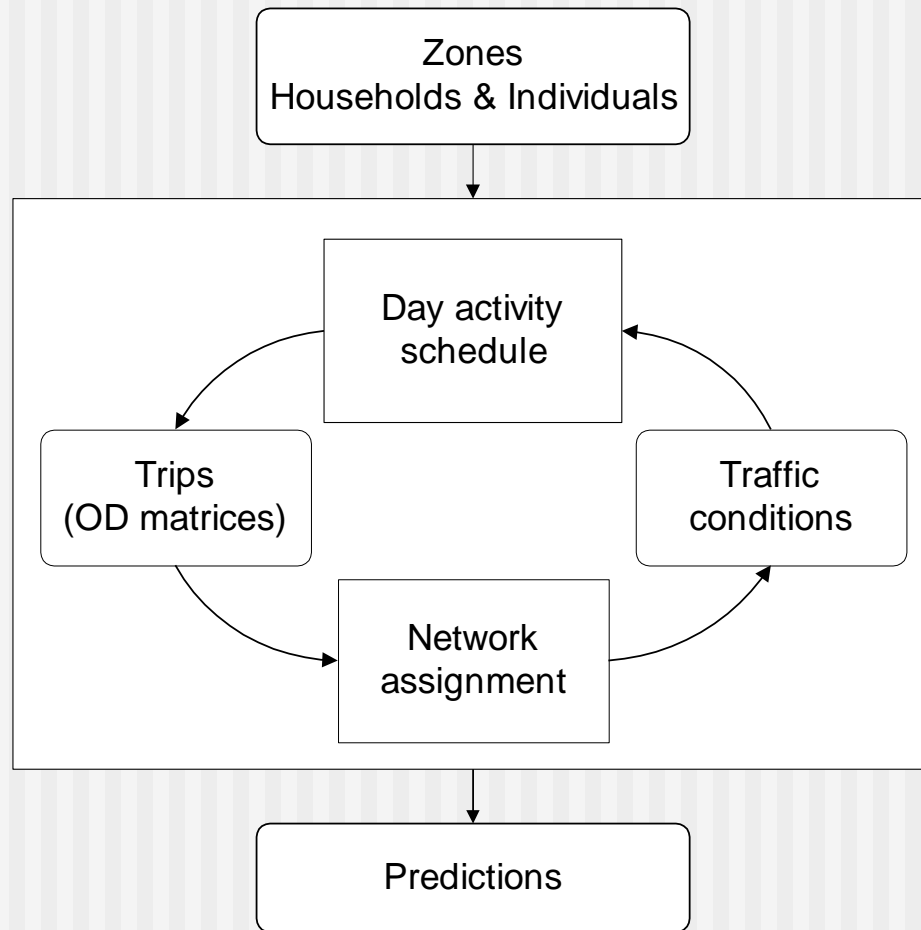

Day Activity Pattern

- primary activity
- primary tour type
- number and purpose of secondary tours
- number and purpose of activity stops in secondary tours

Tours

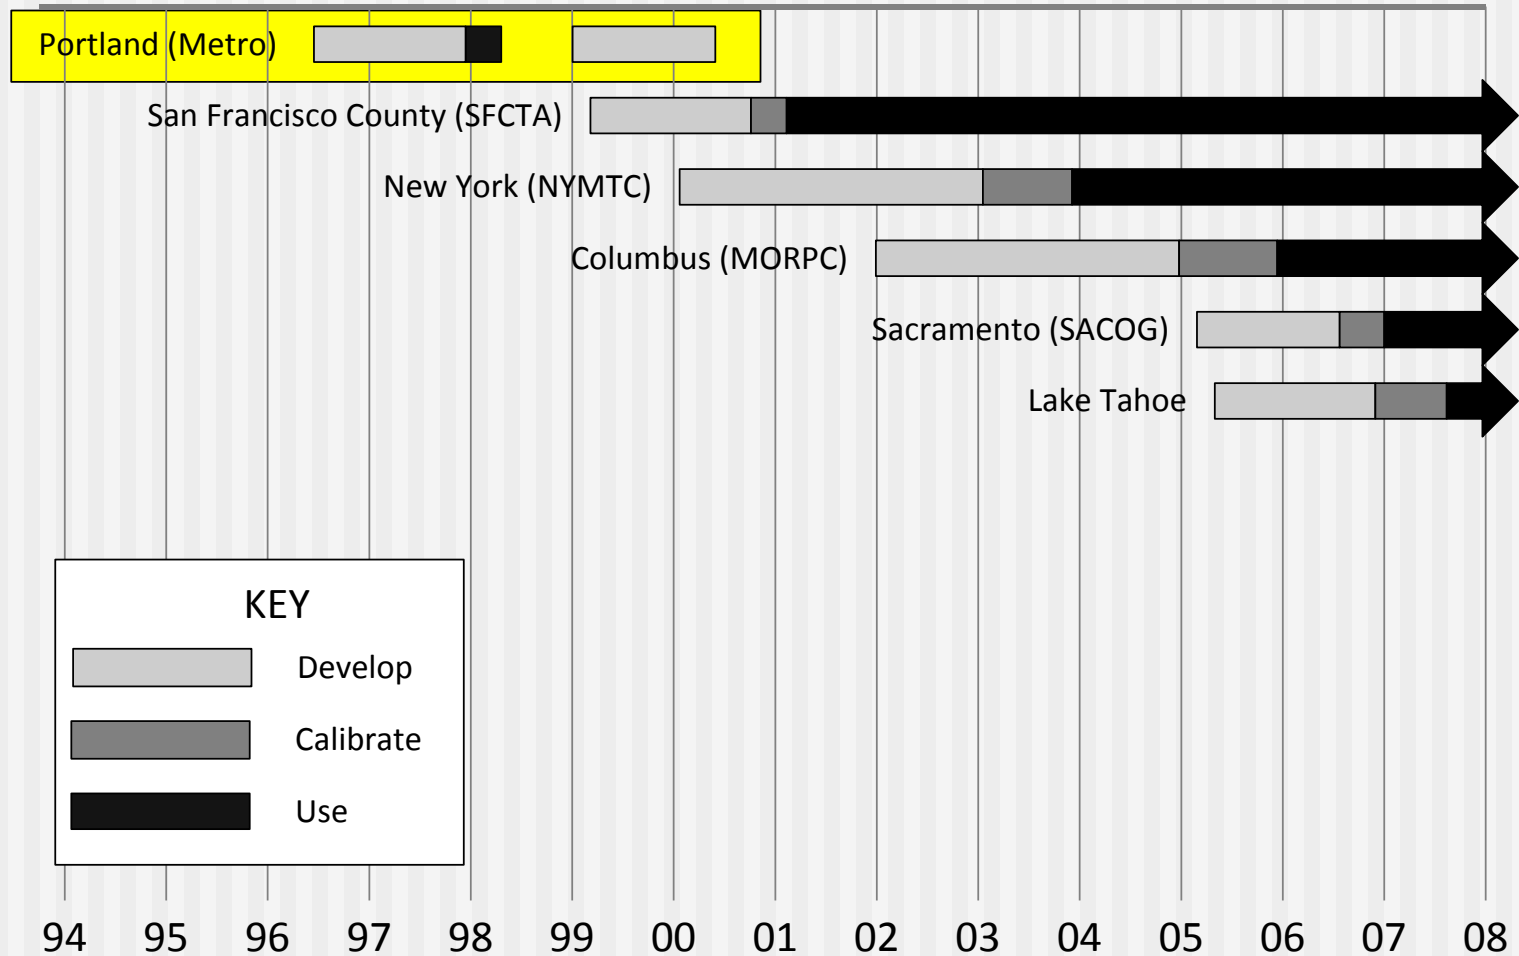

Model Application

Jan 1995: MIT Prototype

- ☹ operational for forecasting and policy analysis
- 😊 available data and discrete choice methods
- 😊 integrated system of daily activity and travel choices
- 😊 tours in a daily activity pattern
- ☹ activity time of day

Early U.S. Projects

1996-1998: Portland Metro

- Features not in MIT prototype
 - Usual work and school location
 - Intermediate stops on tours
 - Detailed activity purposes (8)
 - Detailed spatial resolution (block face)
 - Work-based subtours
 - At-home activities
 - Integration with assignment models
- Used model for policy analysis

Early Application Results (Portland 1998)

Effect of Change in Auto Variable Costs (AVC)			Double AVC all times of day		Double AVC in peak periods		
Purp	Mode	Time of day	% chg Tours	% chg Miles	% chg Tours	% chg Miles	
Work	All	All	-0.8	-9.4	-0.6	-5.5	
	SOV	All	-5.8	-14.6			
		AM peak				-5.9	-13.1
		Off-peak				+1.0	0.0
Maint	SOV	All	-8.7	-21.5	-1.2	-3.6	
Discr			-10.7	-23.1	-1.3	-3.2

Early U.S. Projects

1999-2012: SFCTA

- 1999
 - Ongoing use for policy analysis
 - User benefits calculation for New Starts (SUMMIT) analysis
- 2007
 - Mode choice using tolled versus free paths and distributed values of time
- 2011
 - Bicycle route choice

Early U.S. Projects

2004: MORPC Innovations

- Intra-household interactions
 - HH activity pattern
 - joint tours
 - HH maintenance activities
- Detailed time resolution (1 hr)
- Multithreaded software
- Parking choice sub-model
- Free-parking eligibility model

Early U.S. Projects

2005-2012: SACOG

- Respecified day activity pattern
- High resolution
 - purpose (7)
 - time (1/2 hr)
 - space (parcel)
- Improved integration
- Equilibration techniques

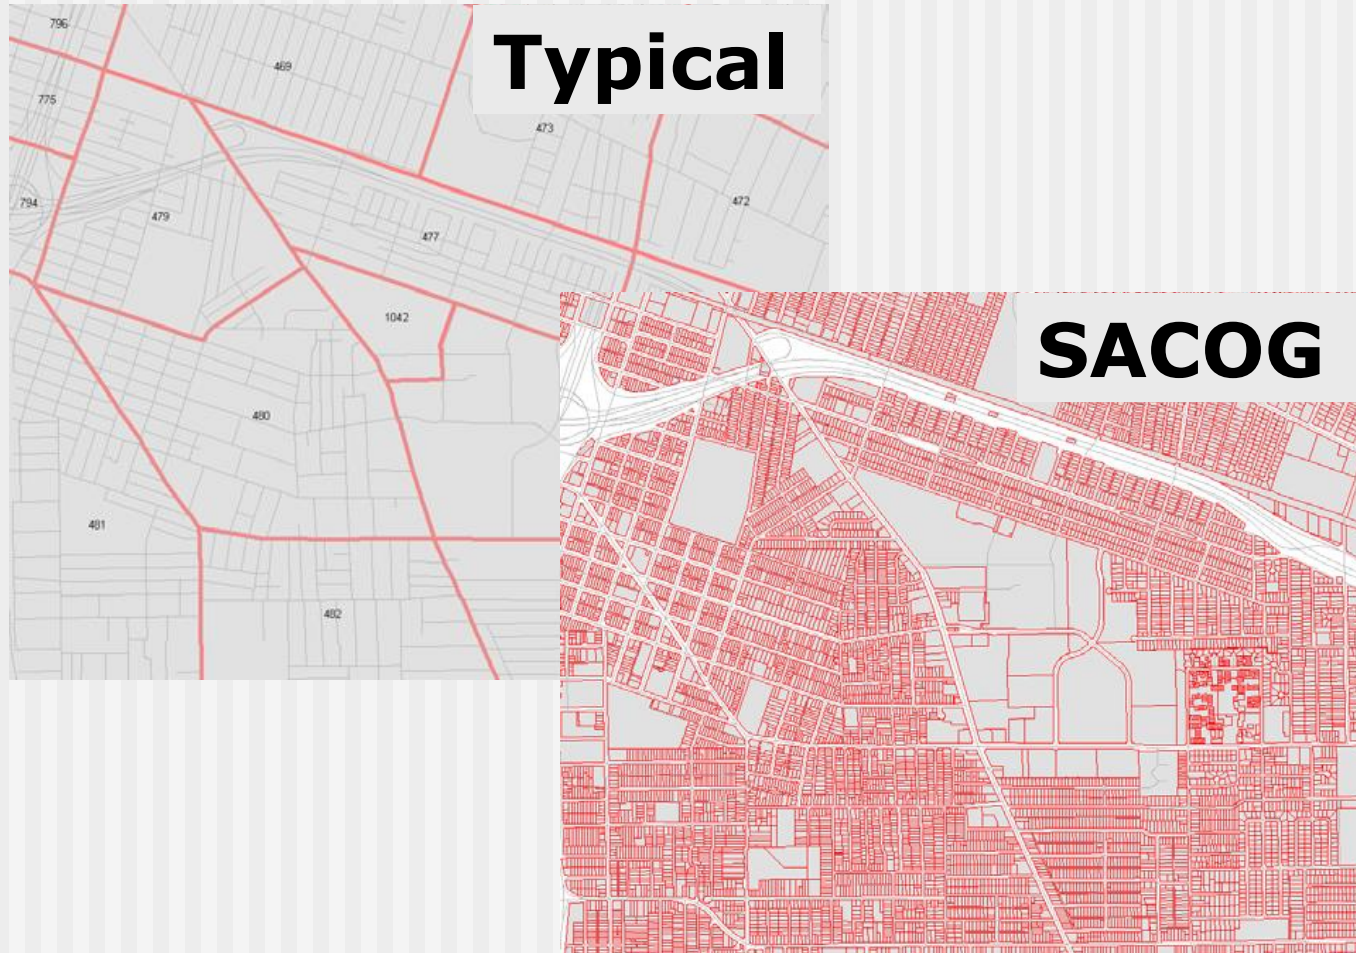

Disaggregating Purpose

Typical	SACOG
Work	Work
School	School
Maintenance	Escort
	Personal Business
	Shopping
Discretionary	Meal
	Social/recreation

Disaggregating Time

Typical	SACOG
AM peak Midday PM peak evening night & early AM	48 half-hour periods

Disaggregating Location— 750,000 parcels

2005-2012: SACOG

- Respecified day activity pattern
- High resolution
 - purpose (7)
 - time (1/2 hr)
 - space (parcel)
- Improved integration
- Equilibration techniques

Early U.S. Projects

2007-2008 Political Impetus

- Issues
 - land use
 - road pricing
 - energy
 - environment

TRB Special Report 288 (2007)

- committee formed by FHWA, FTA, Secretary of Transportation, and TRB
- to **evaluate** the state of practice in metropolitan travel forecasting, and **recommend** improvements
- report:
“METROPOLITAN TRAVEL FORECASTING:
Current Practice and Future Direction”

TRB Special Report 288

Evaluation

- "The basic modeling approach at most MPOs remains a sequential four step process... "
- "The demands on forecasting models have grown significantly in recent years... Existing models are inadequate to address many of these new concerns."
- "...the processes...in the four-step model are not behavioral in nature; ... and are not well suited to representing travelers' responses to the complex range of policies typically of interest to today's planners and politicians."

TRB Special Report 288

Recommendation

"The committee recommends that the USDOT, the FHWA, and FTA take the (seven) steps outlined below to assist in the needed improvements in practice.

2. Support and provide funding for the continued development, demonstration, and implementation of advanced modeling approaches, including **activity-based models**.

4. Continue support for the implementation of **activity-based modeling** and other advanced practices; considerably expand this support through deployment efforts in multiple urban areas."

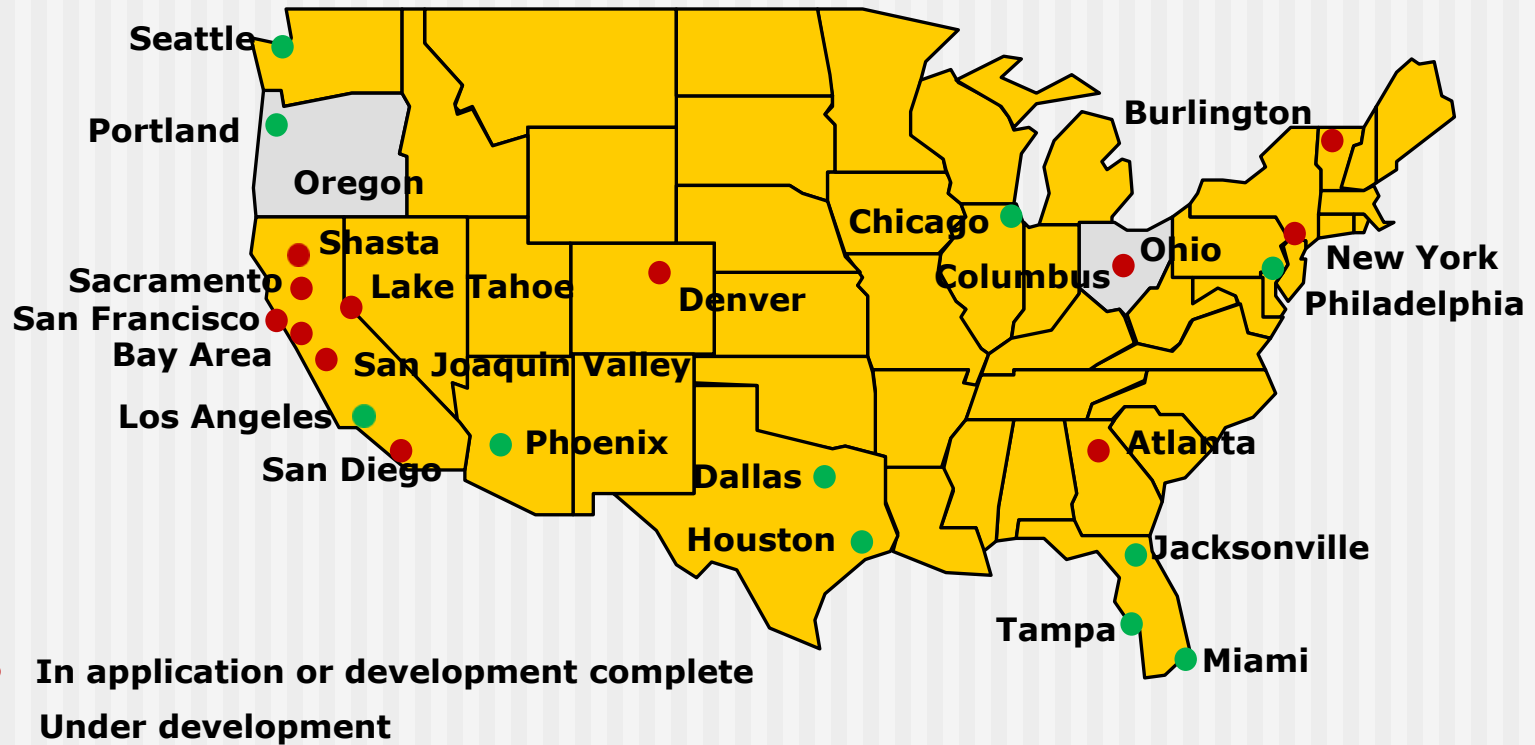

California

- **Senate Bill 375 (Sep 2008)**
requires the California Transportation Commission to maintain guidelines for travel demand models
- **CTC Guidelines (May 2008)**
The largest four MPOs and other COGs and RTPAs with rapid growth and established transit systems "should develop tour-based travel models in the short term and **activity-based travel models** within a few years."

The Projects

U.S. AB Models in 2012

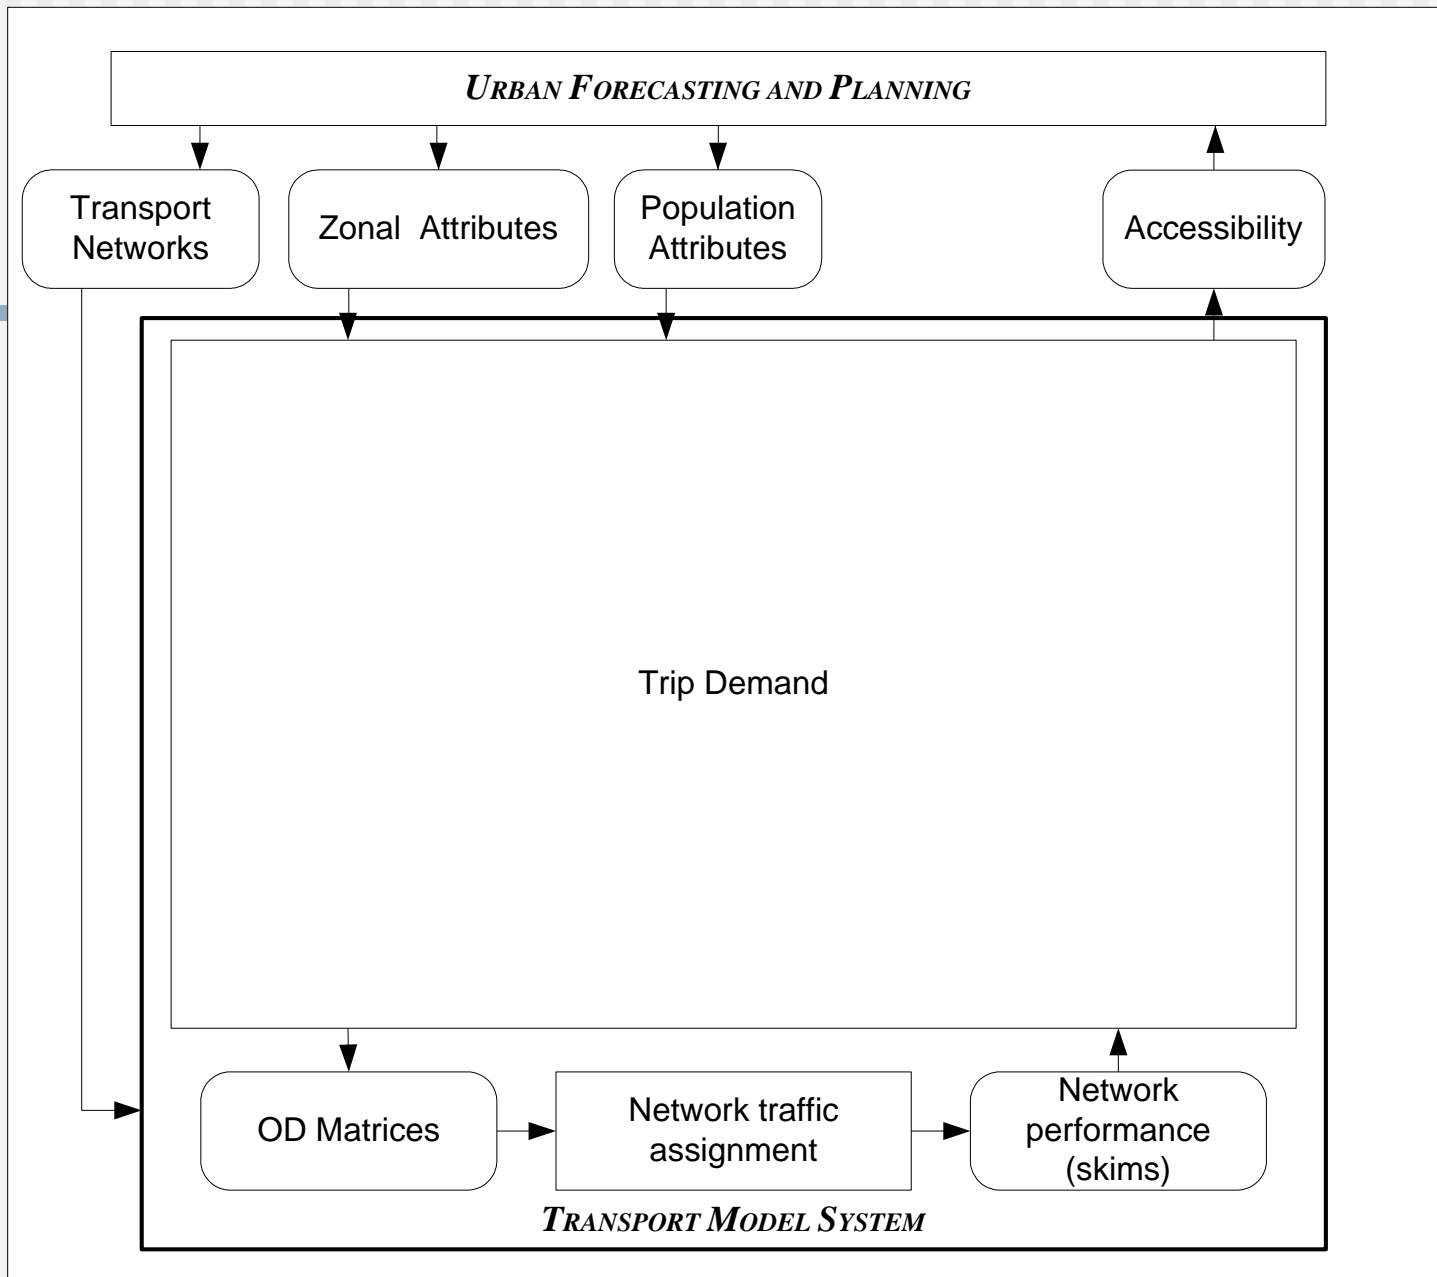

Pending additions?

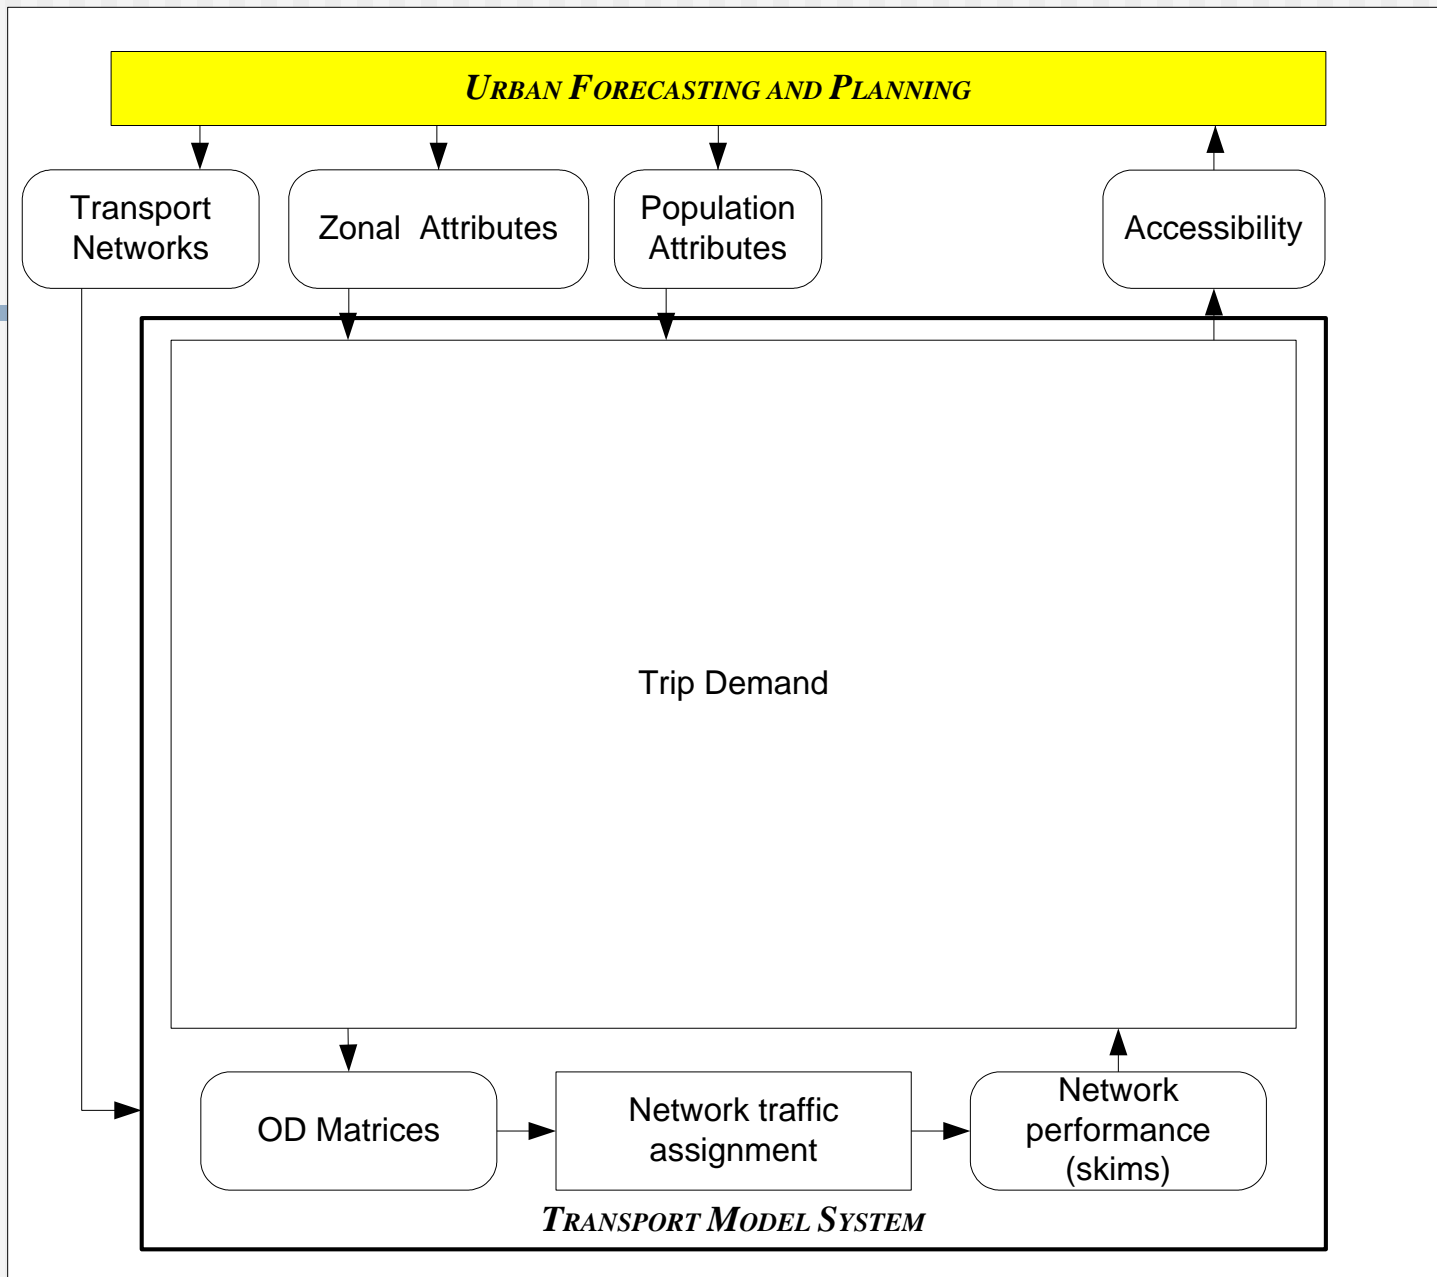

- Pending in United States?
 - Boston
 - Nashville
 - Cincinnati
- International developments
 - Tel Aviv and Jerusalem
 - Copenhagen
 - Beijing?

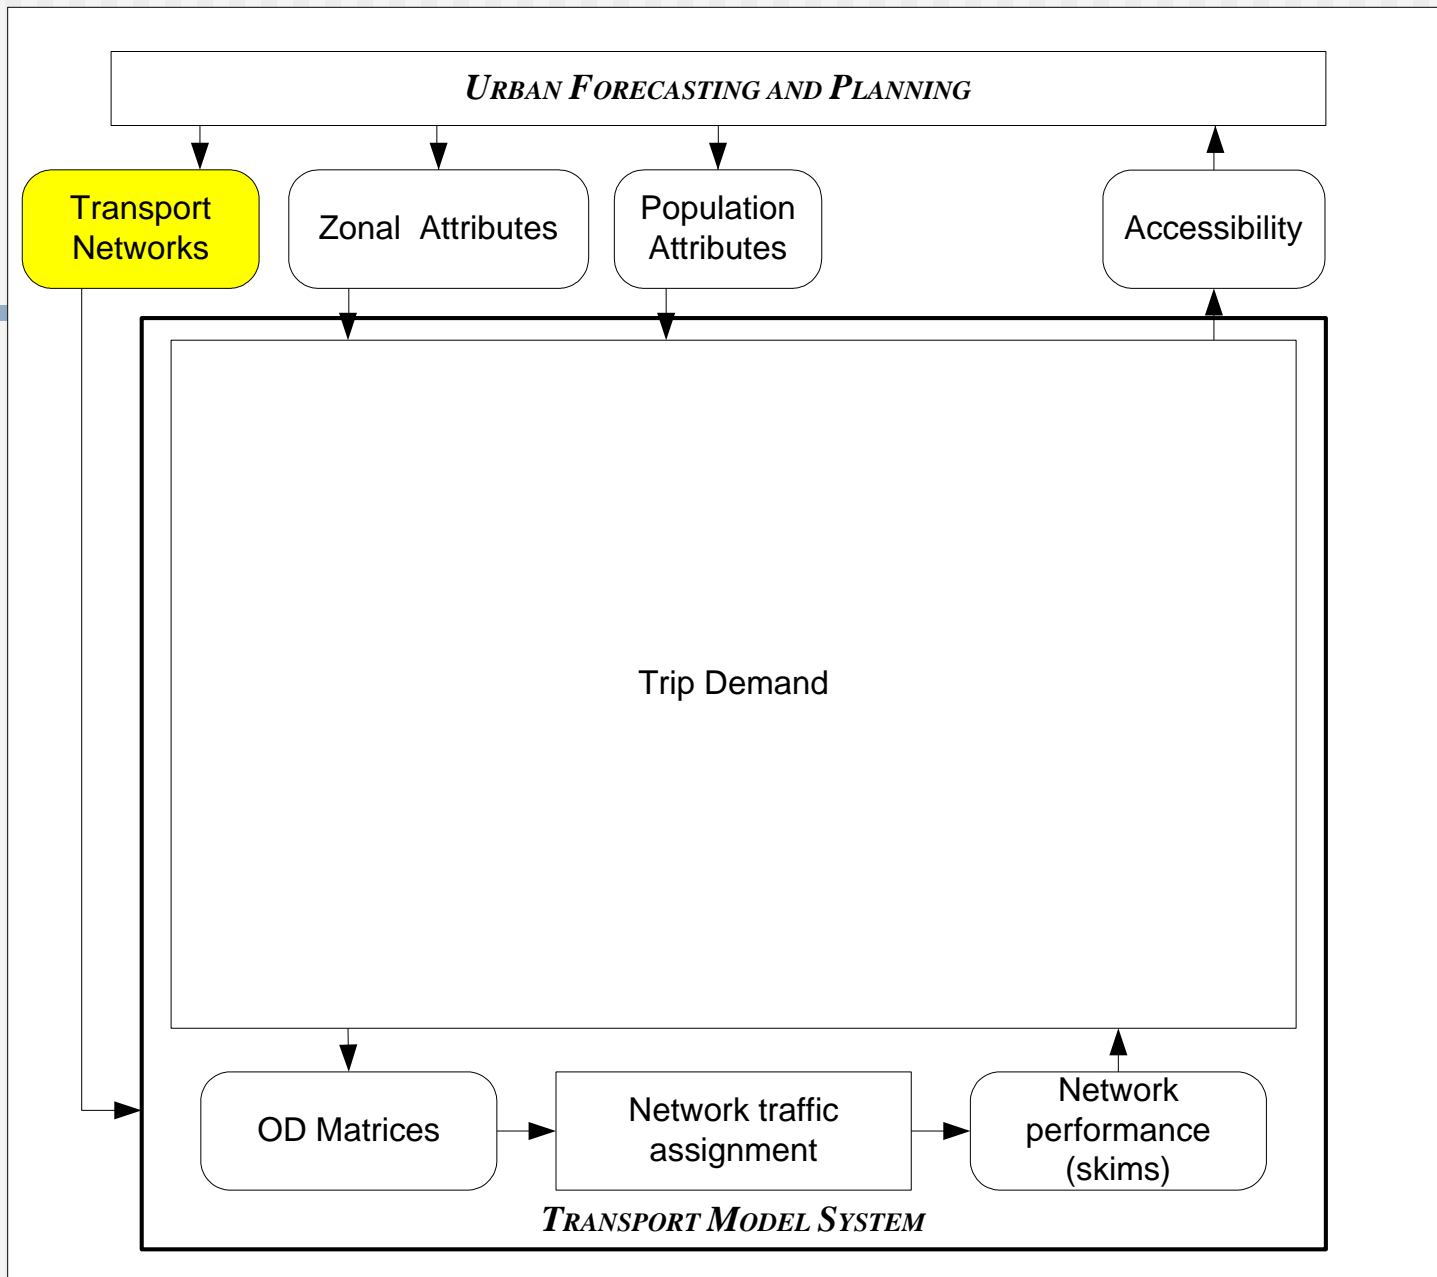

Activity-Based Models

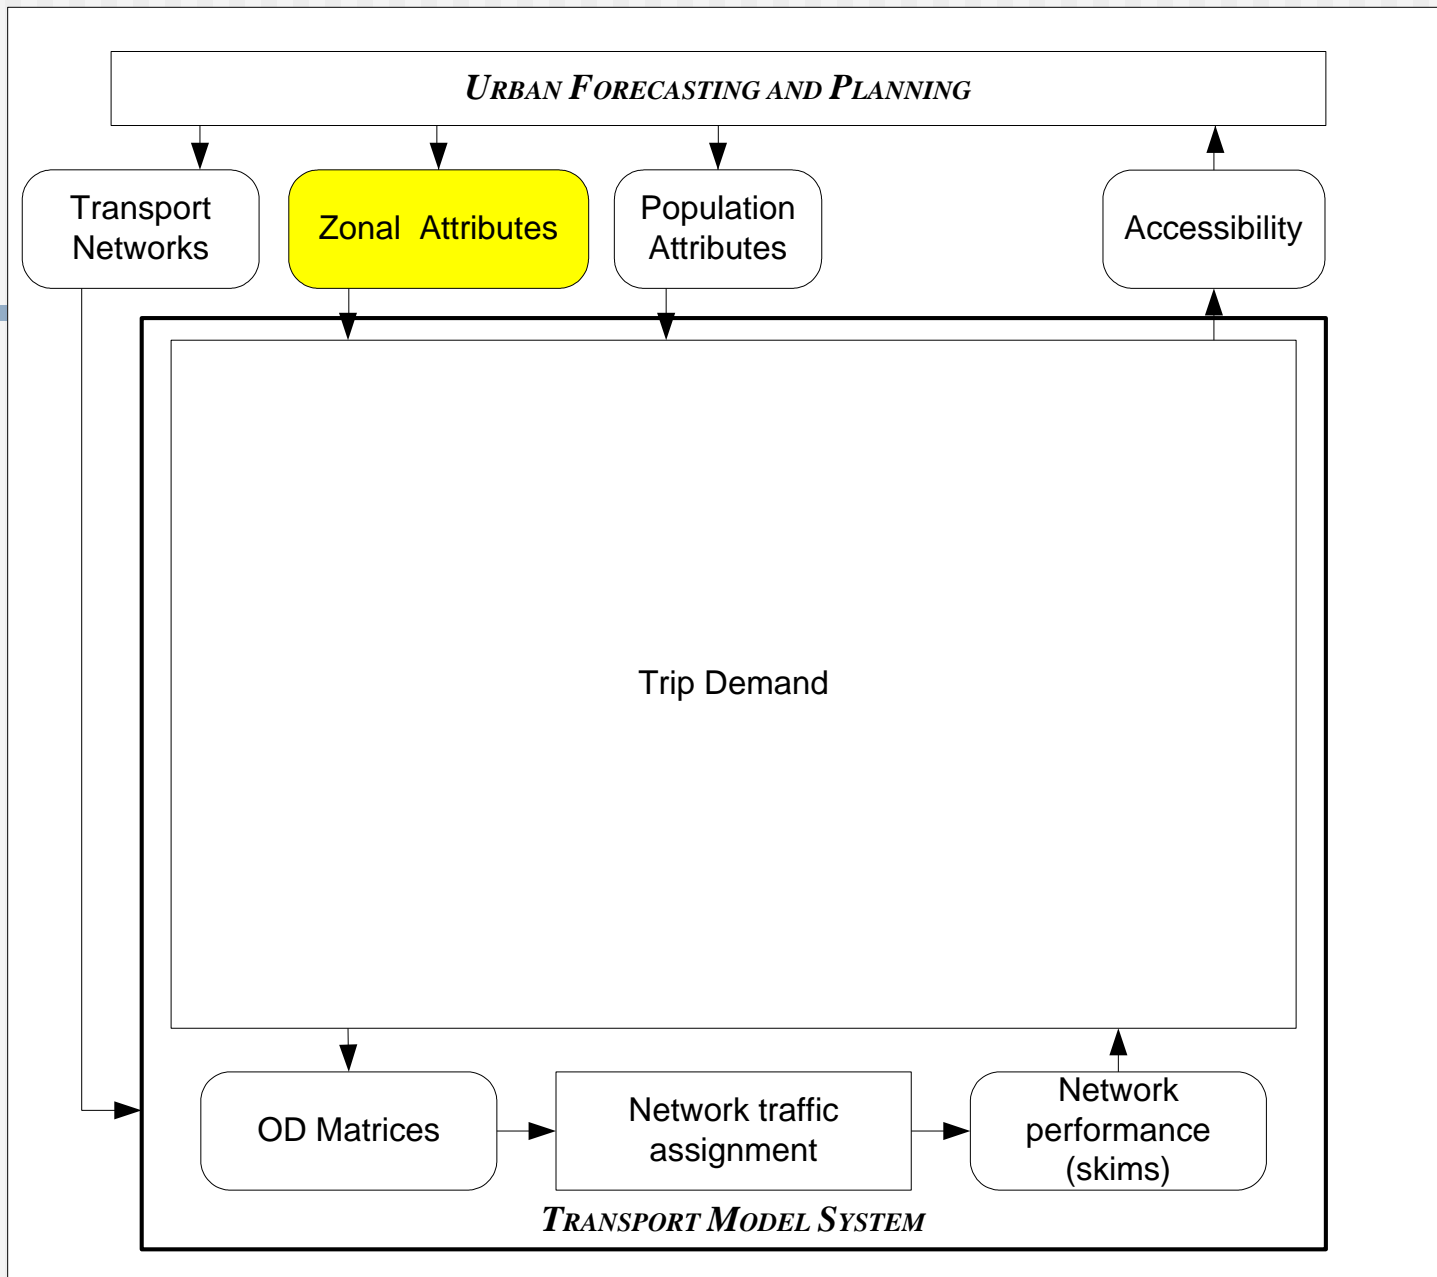

1993-2012

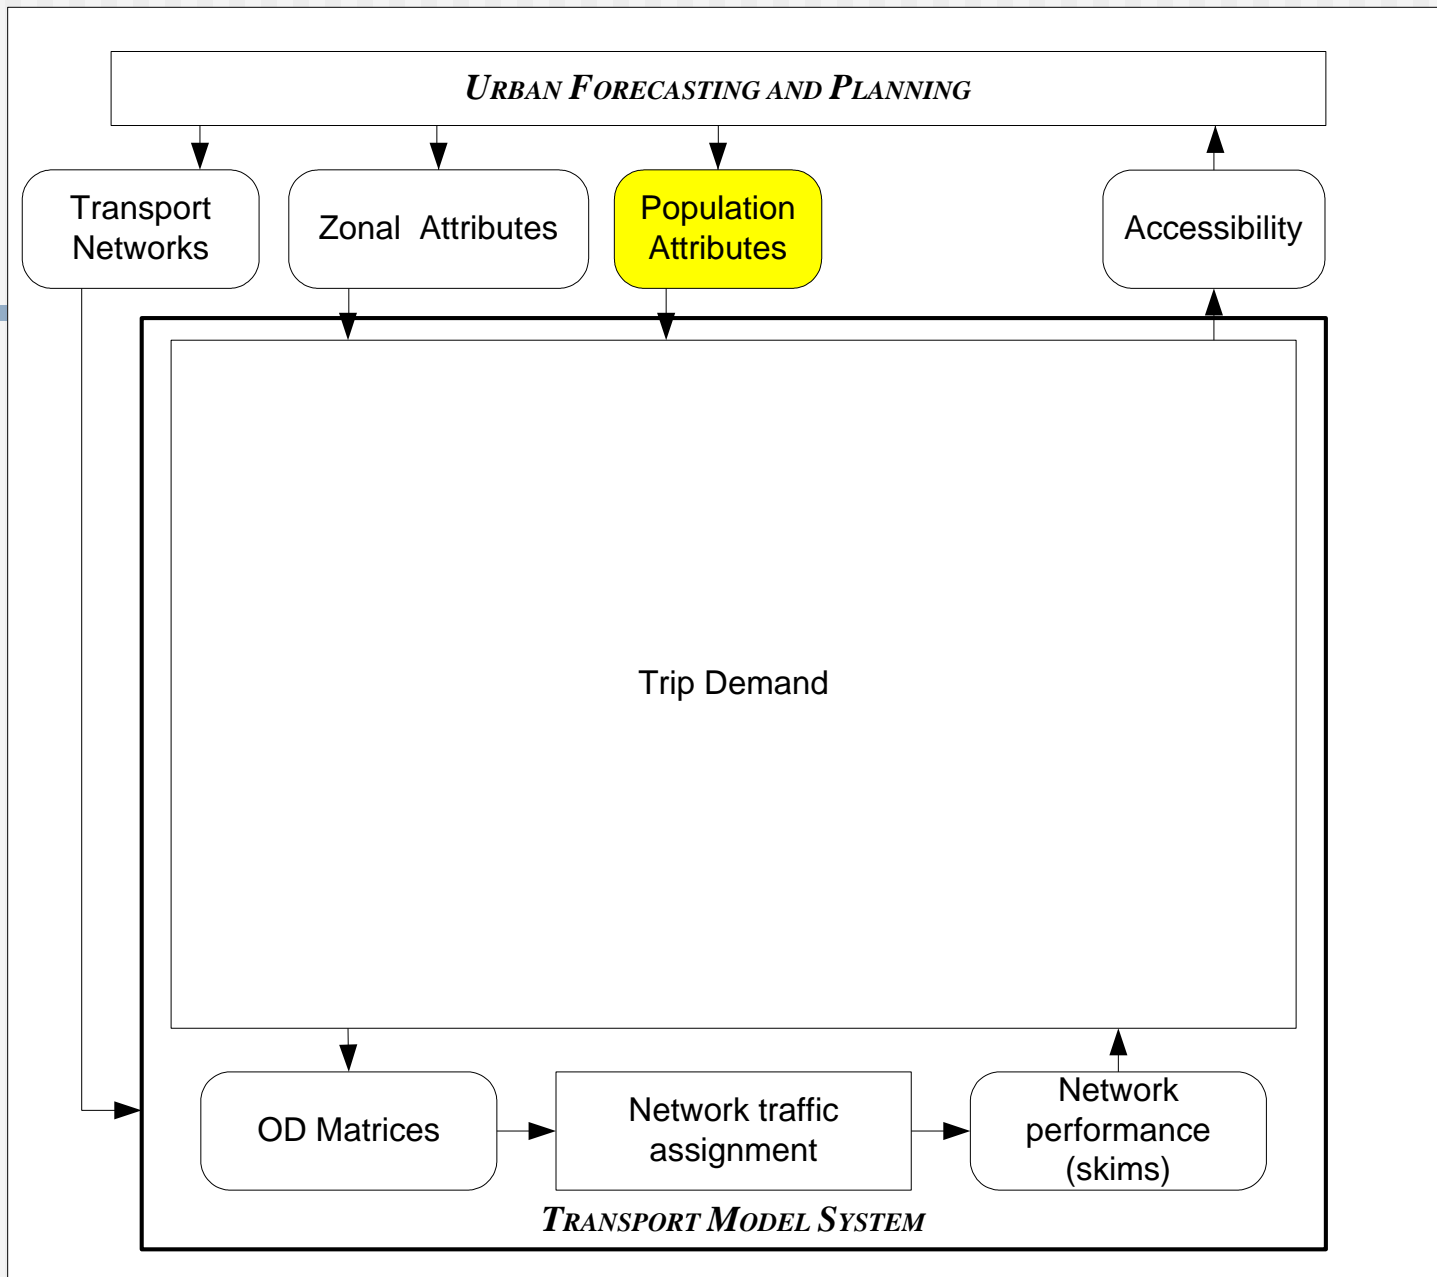

- Early history in the U.S.
- **Basics of the “Activity-Based” model systems**
- Advanced features

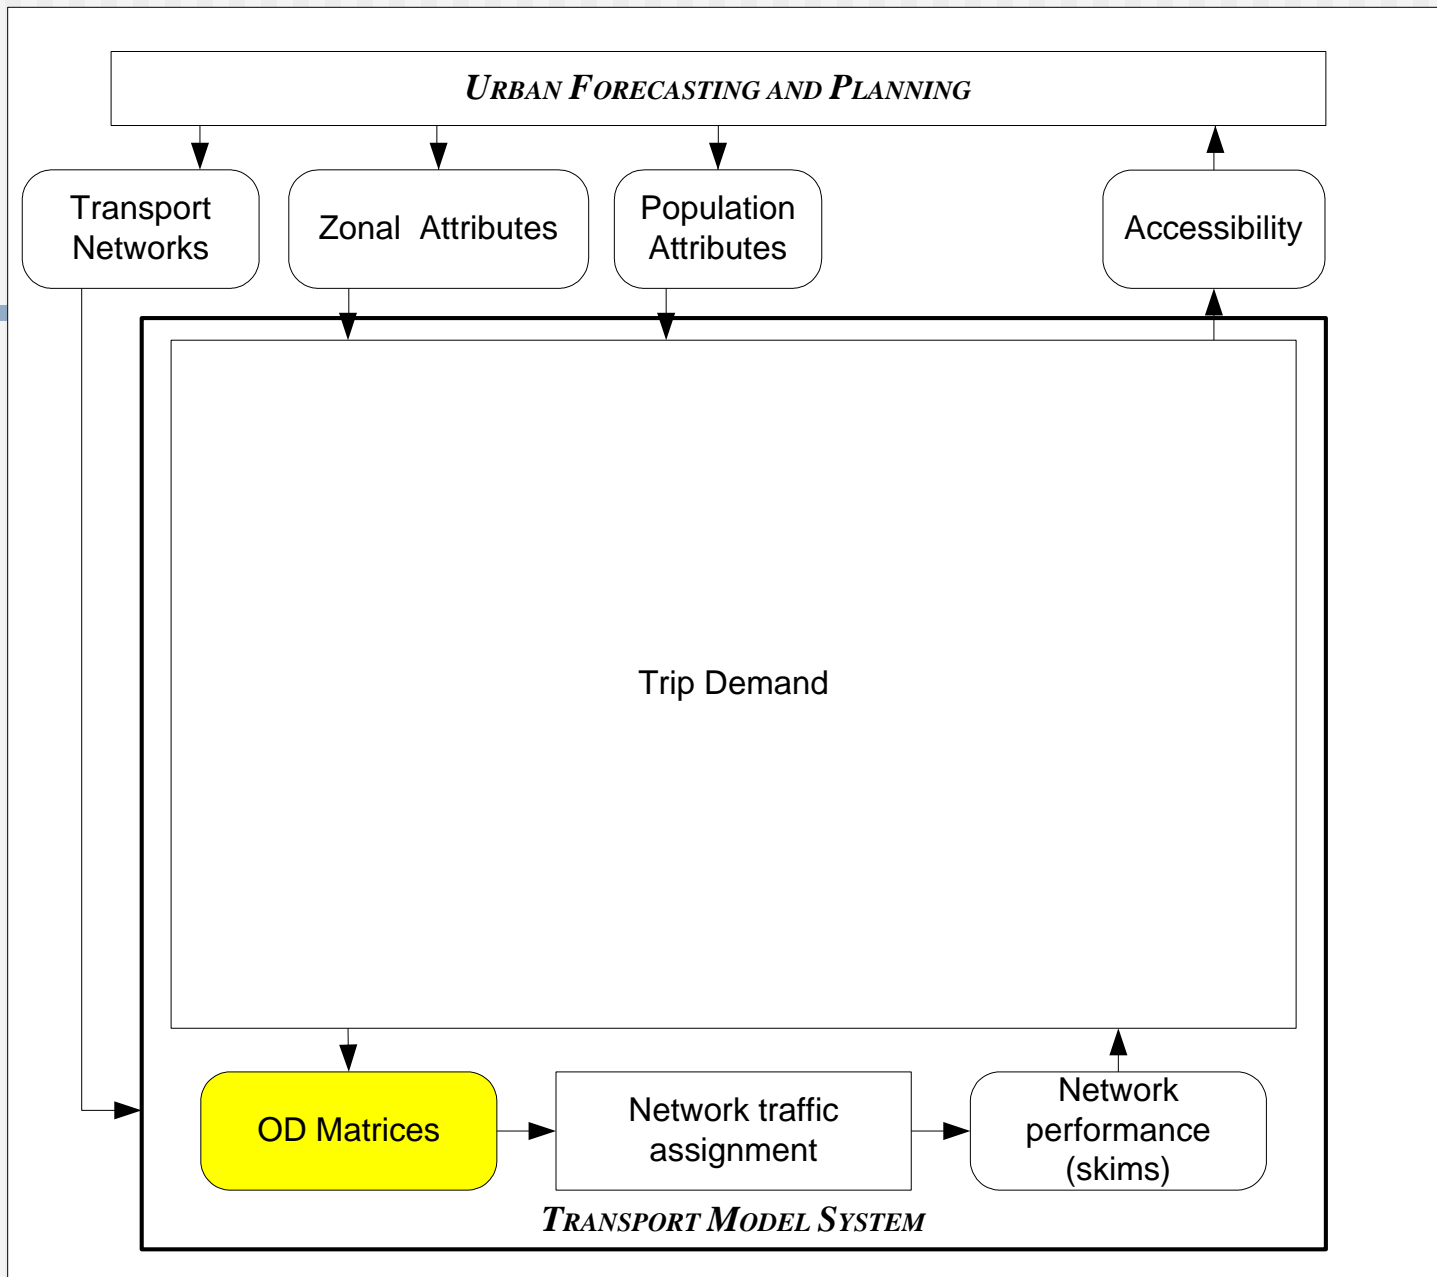

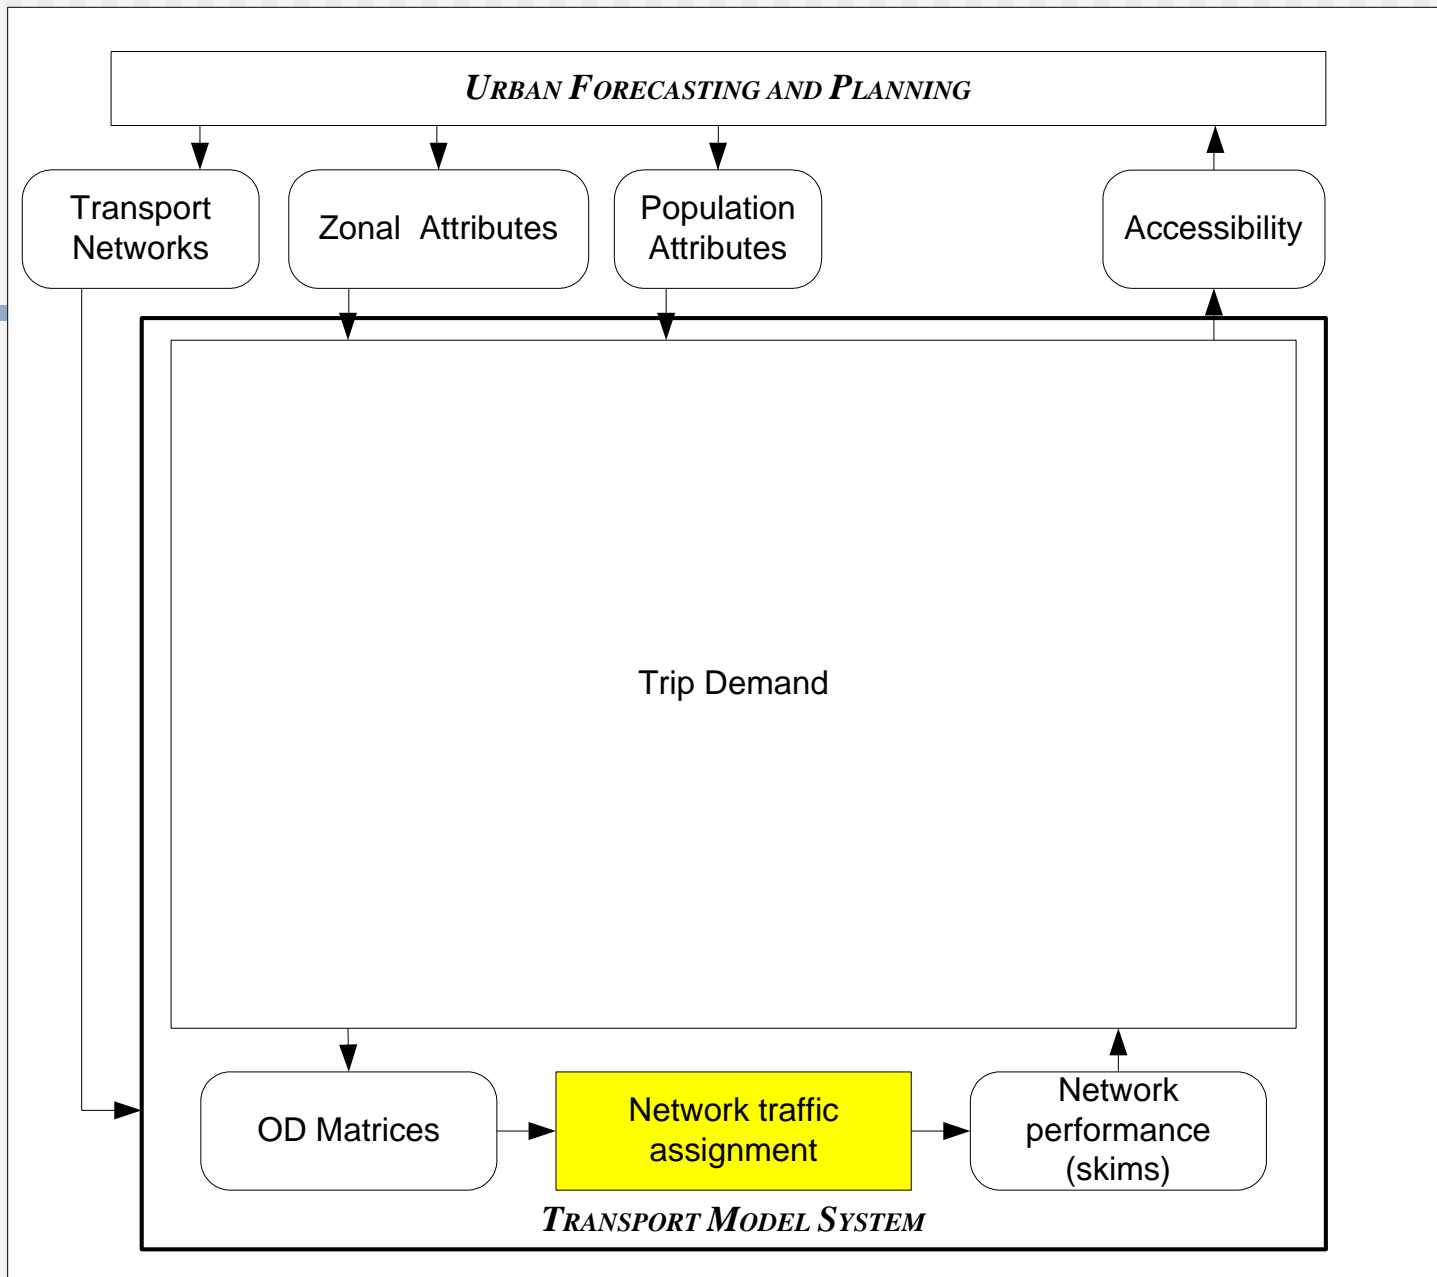

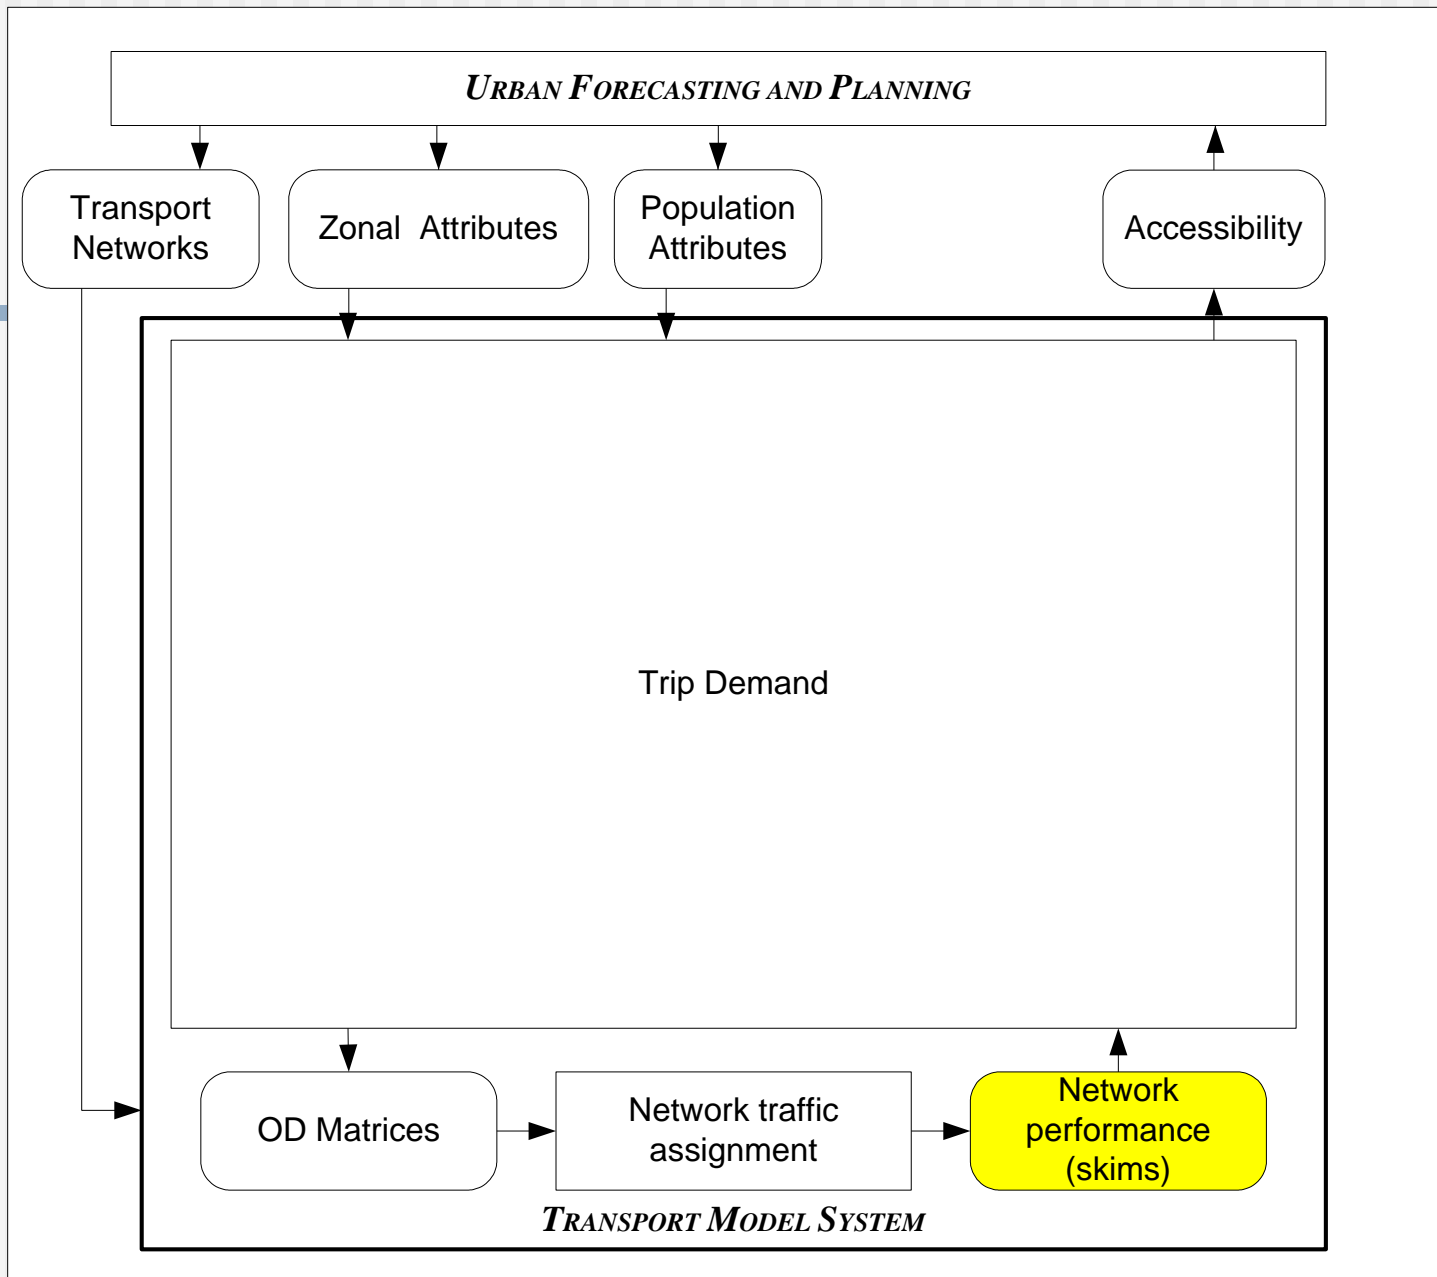

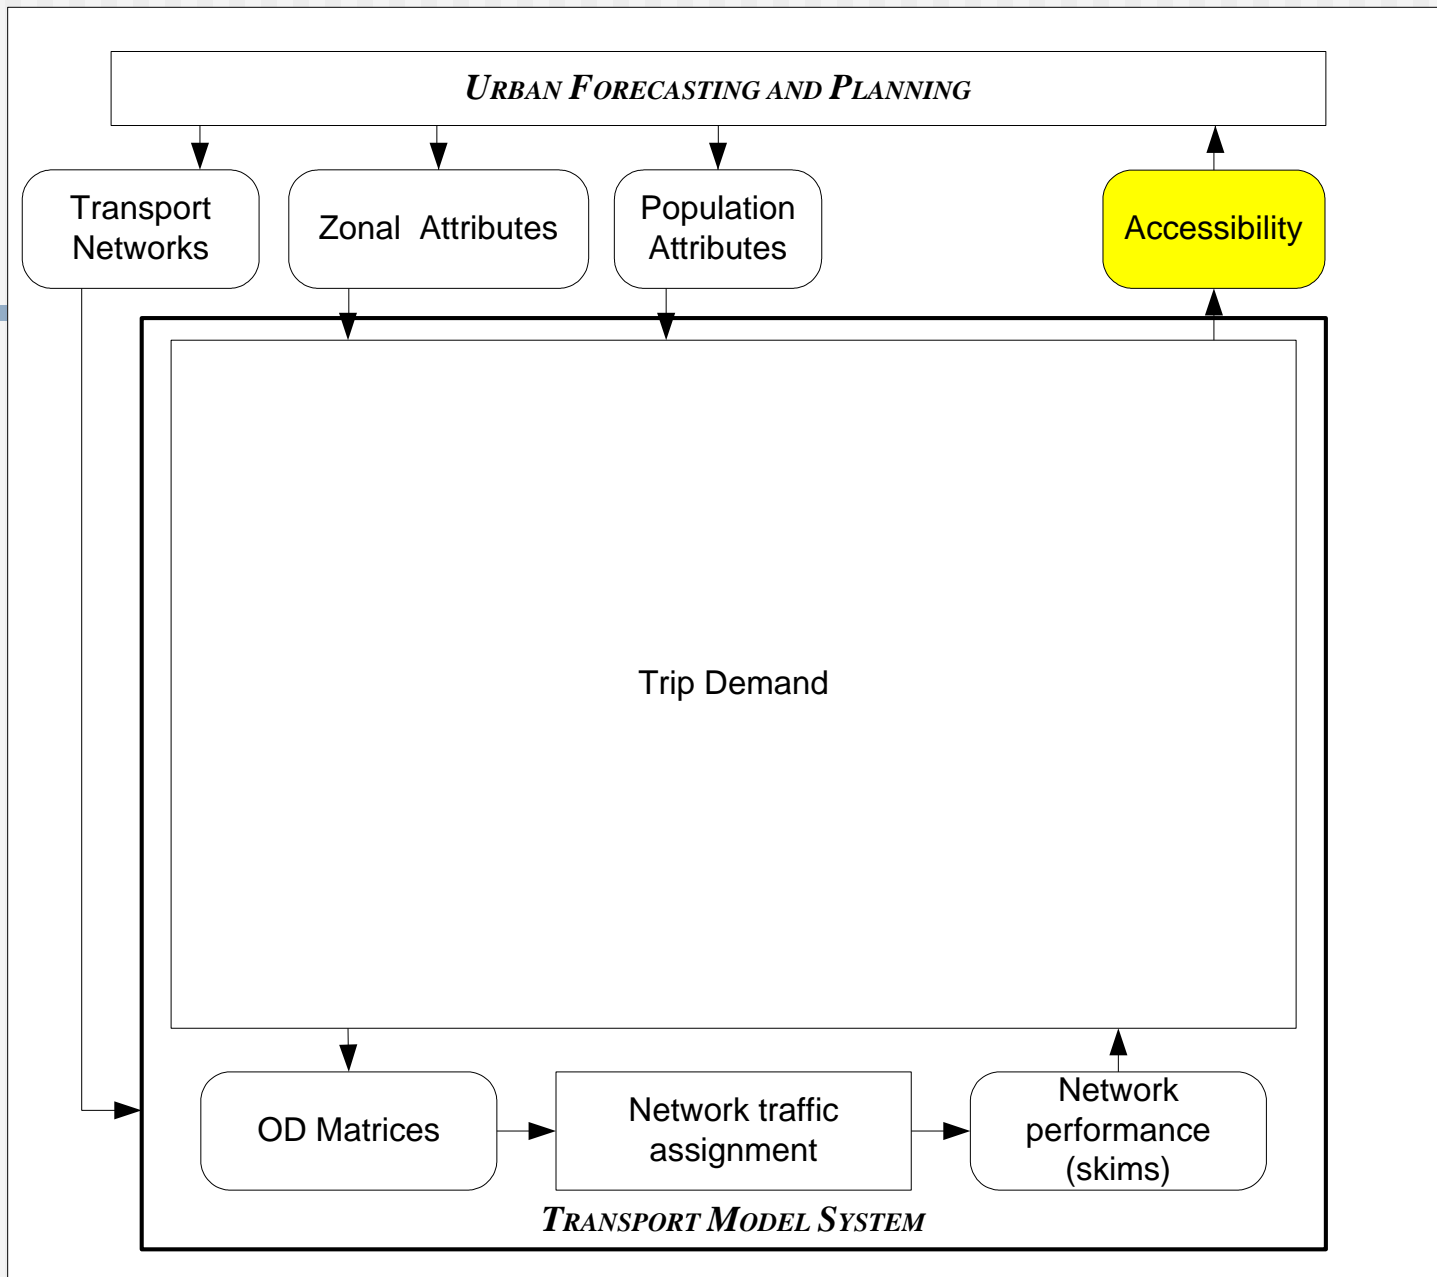

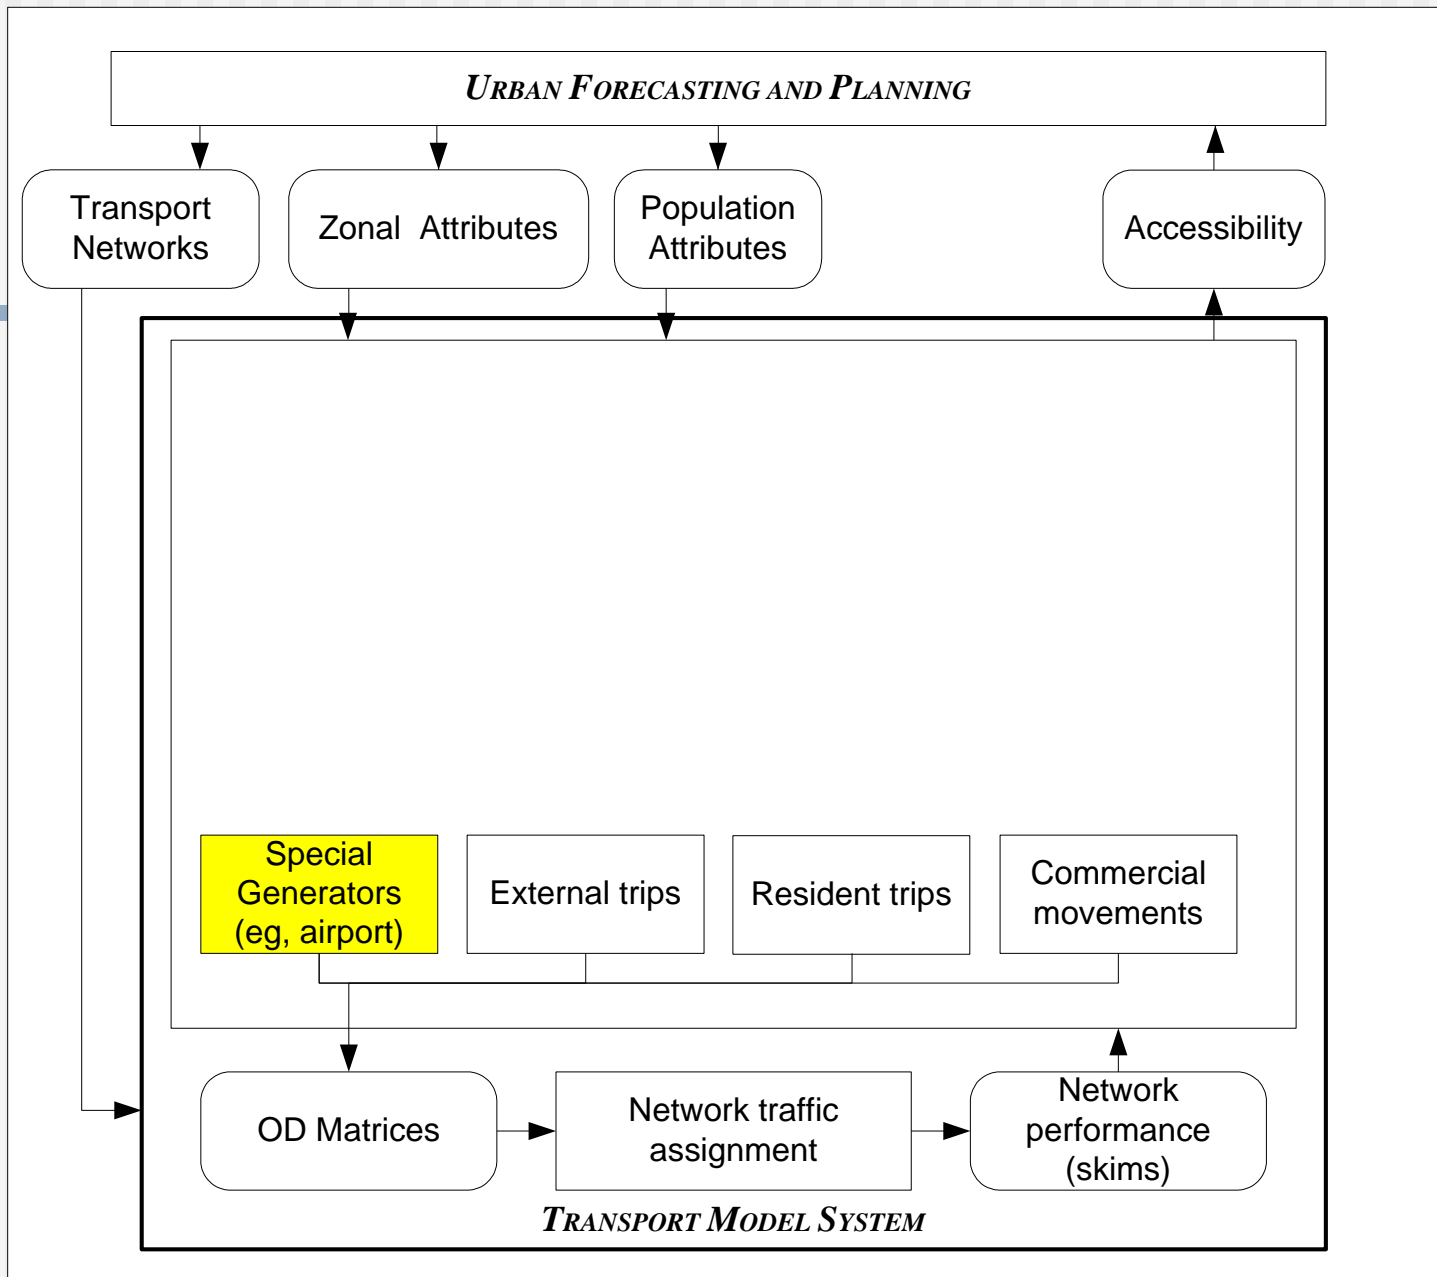

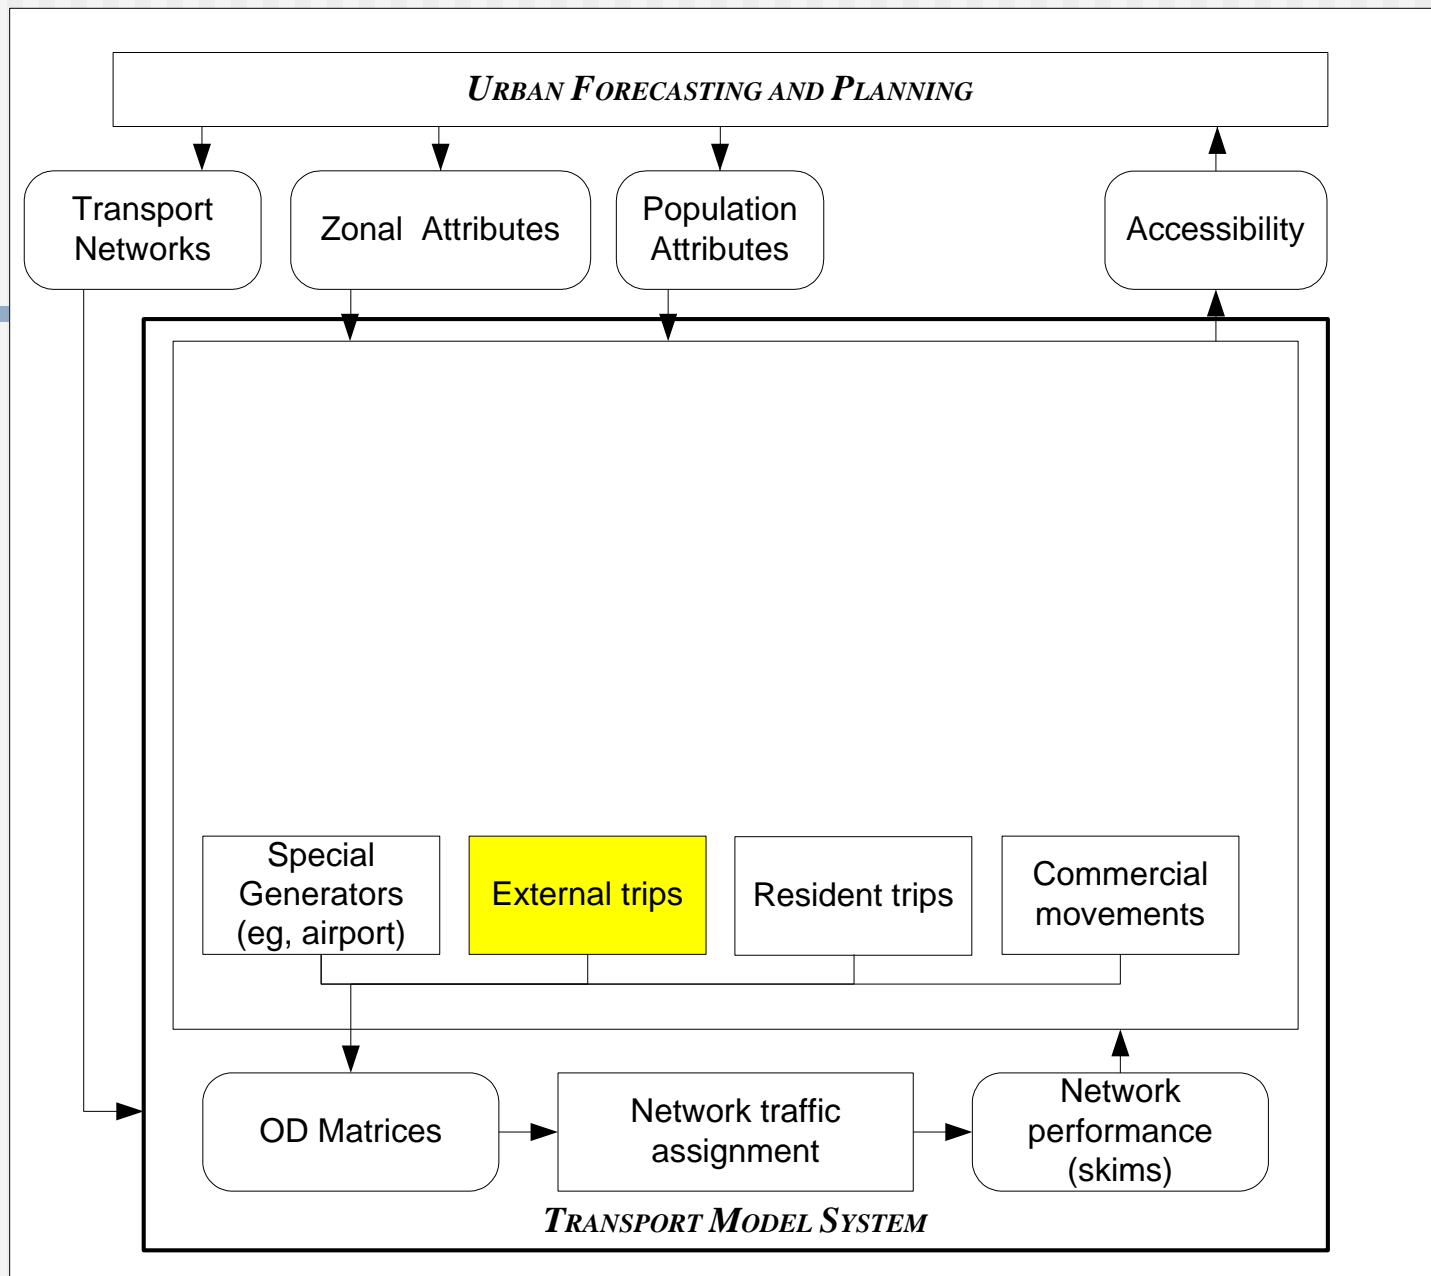

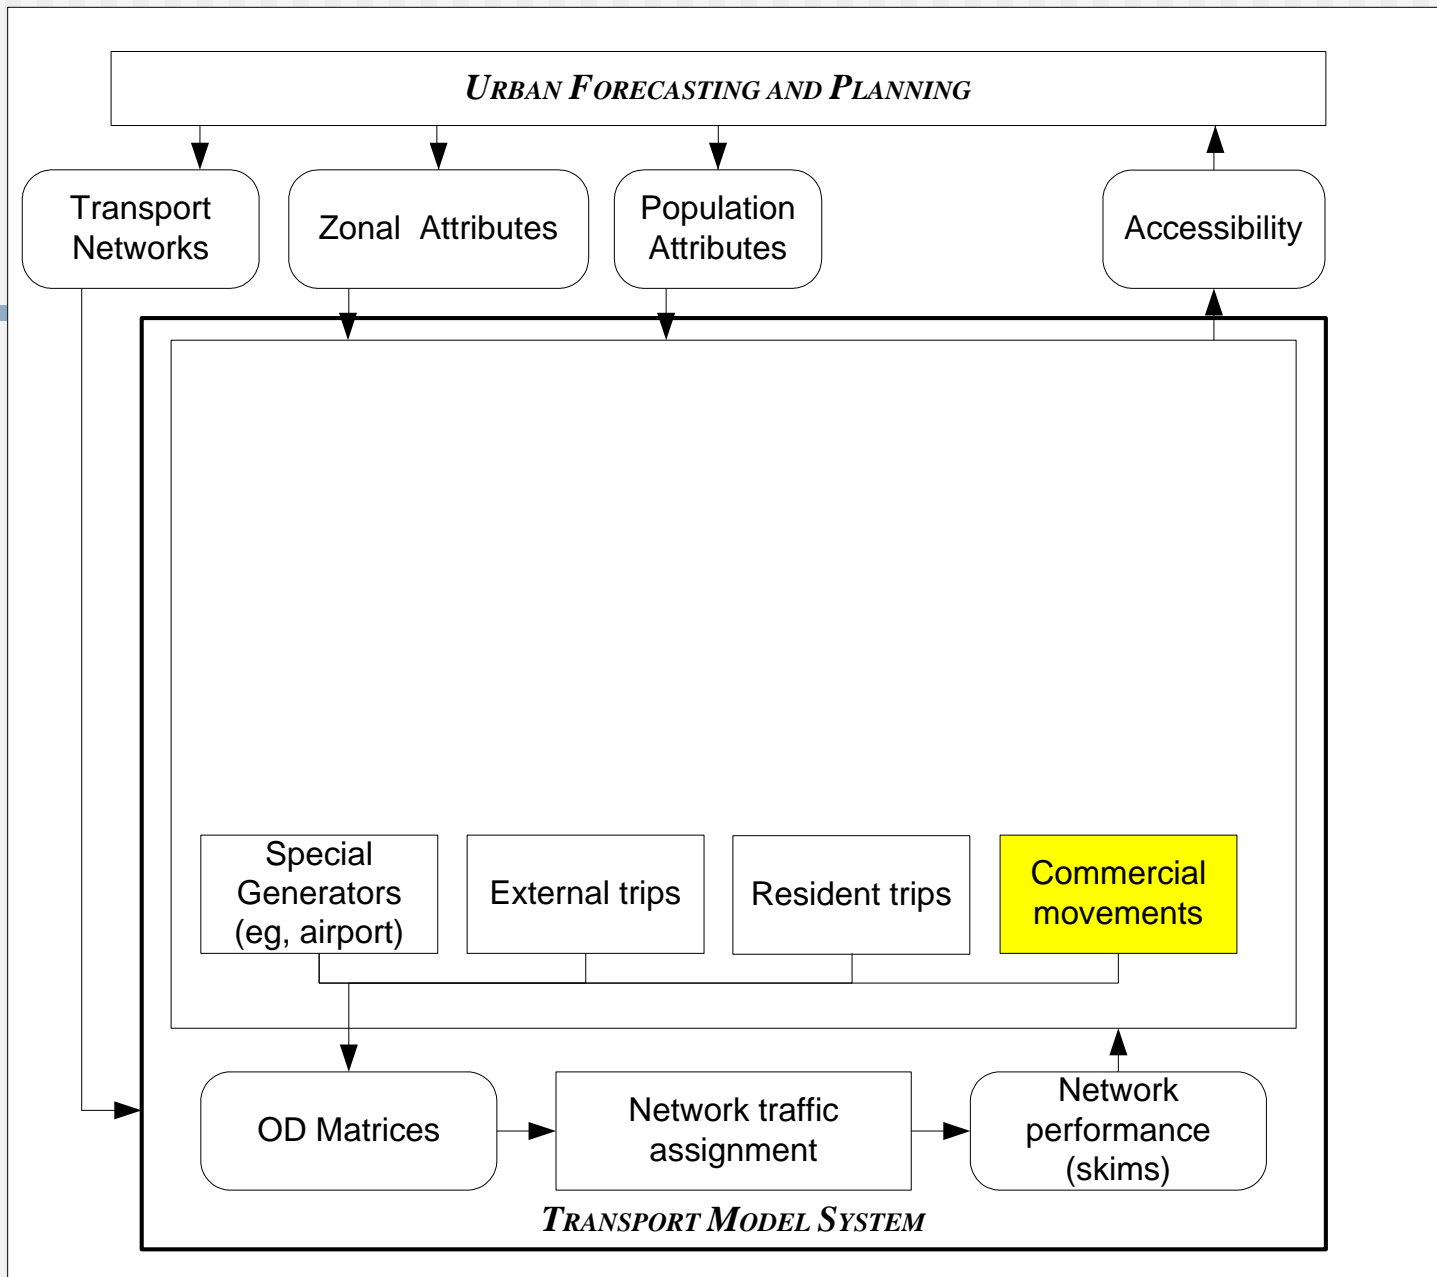

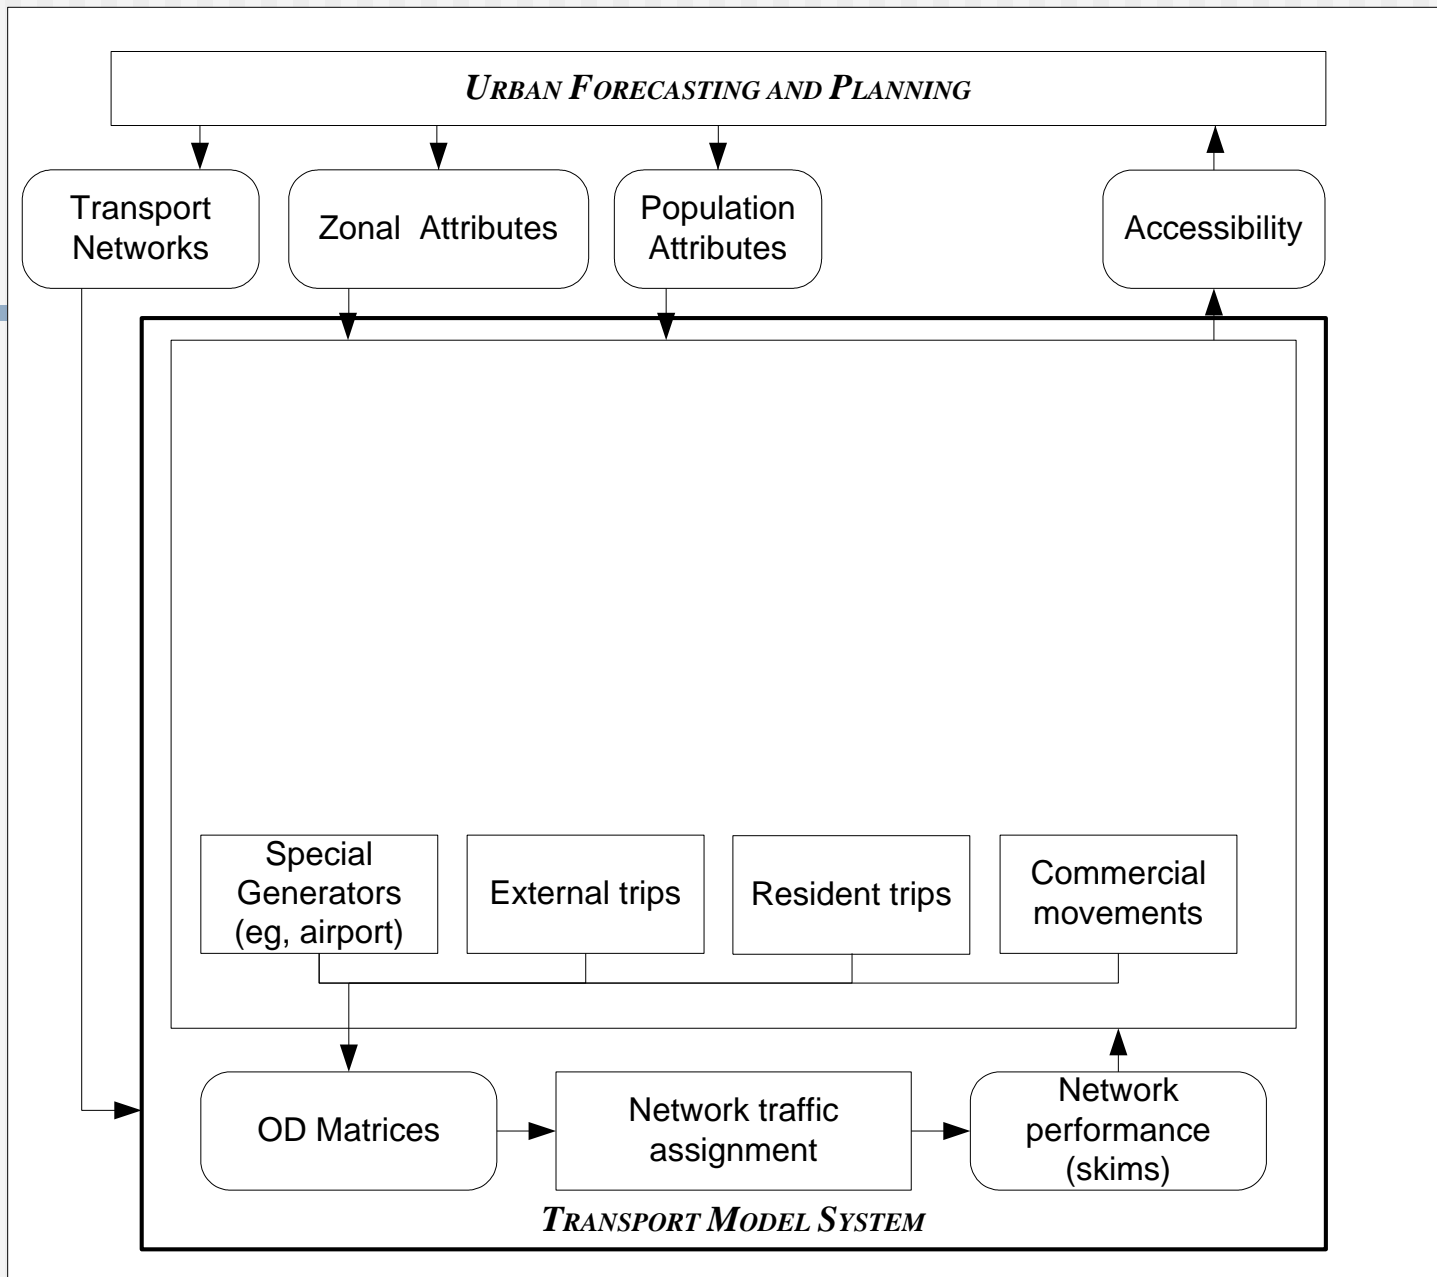

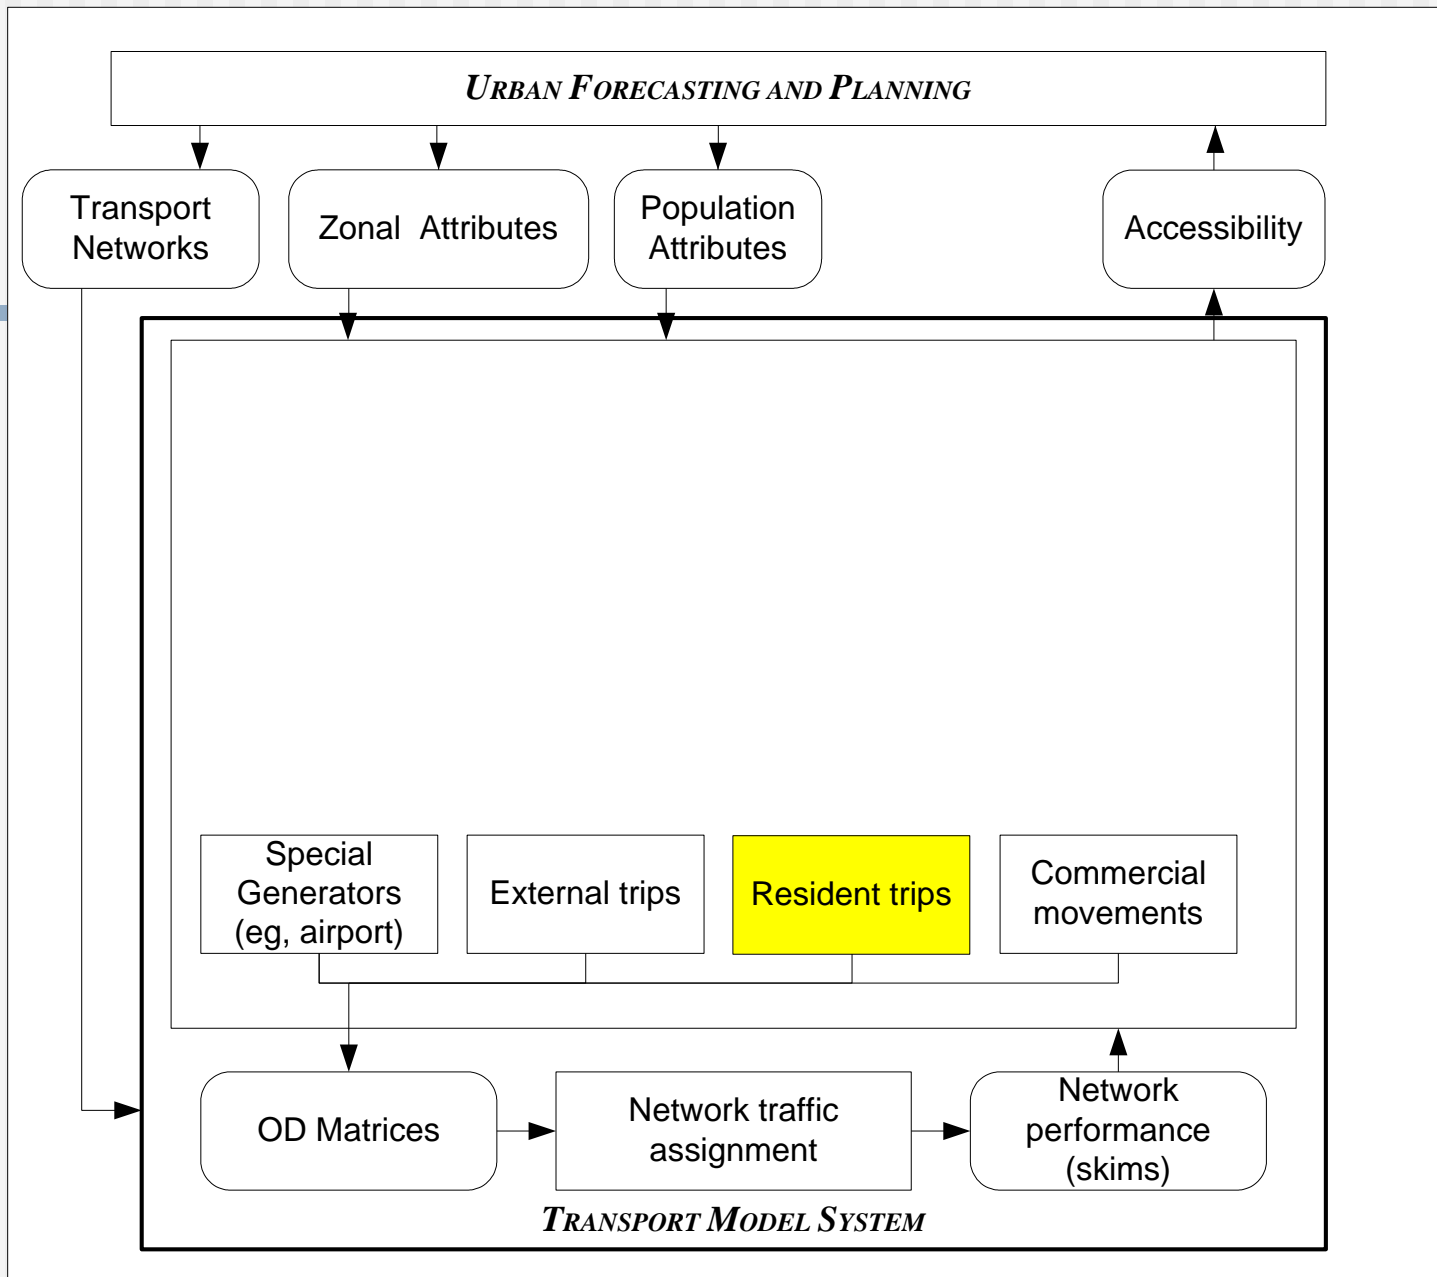

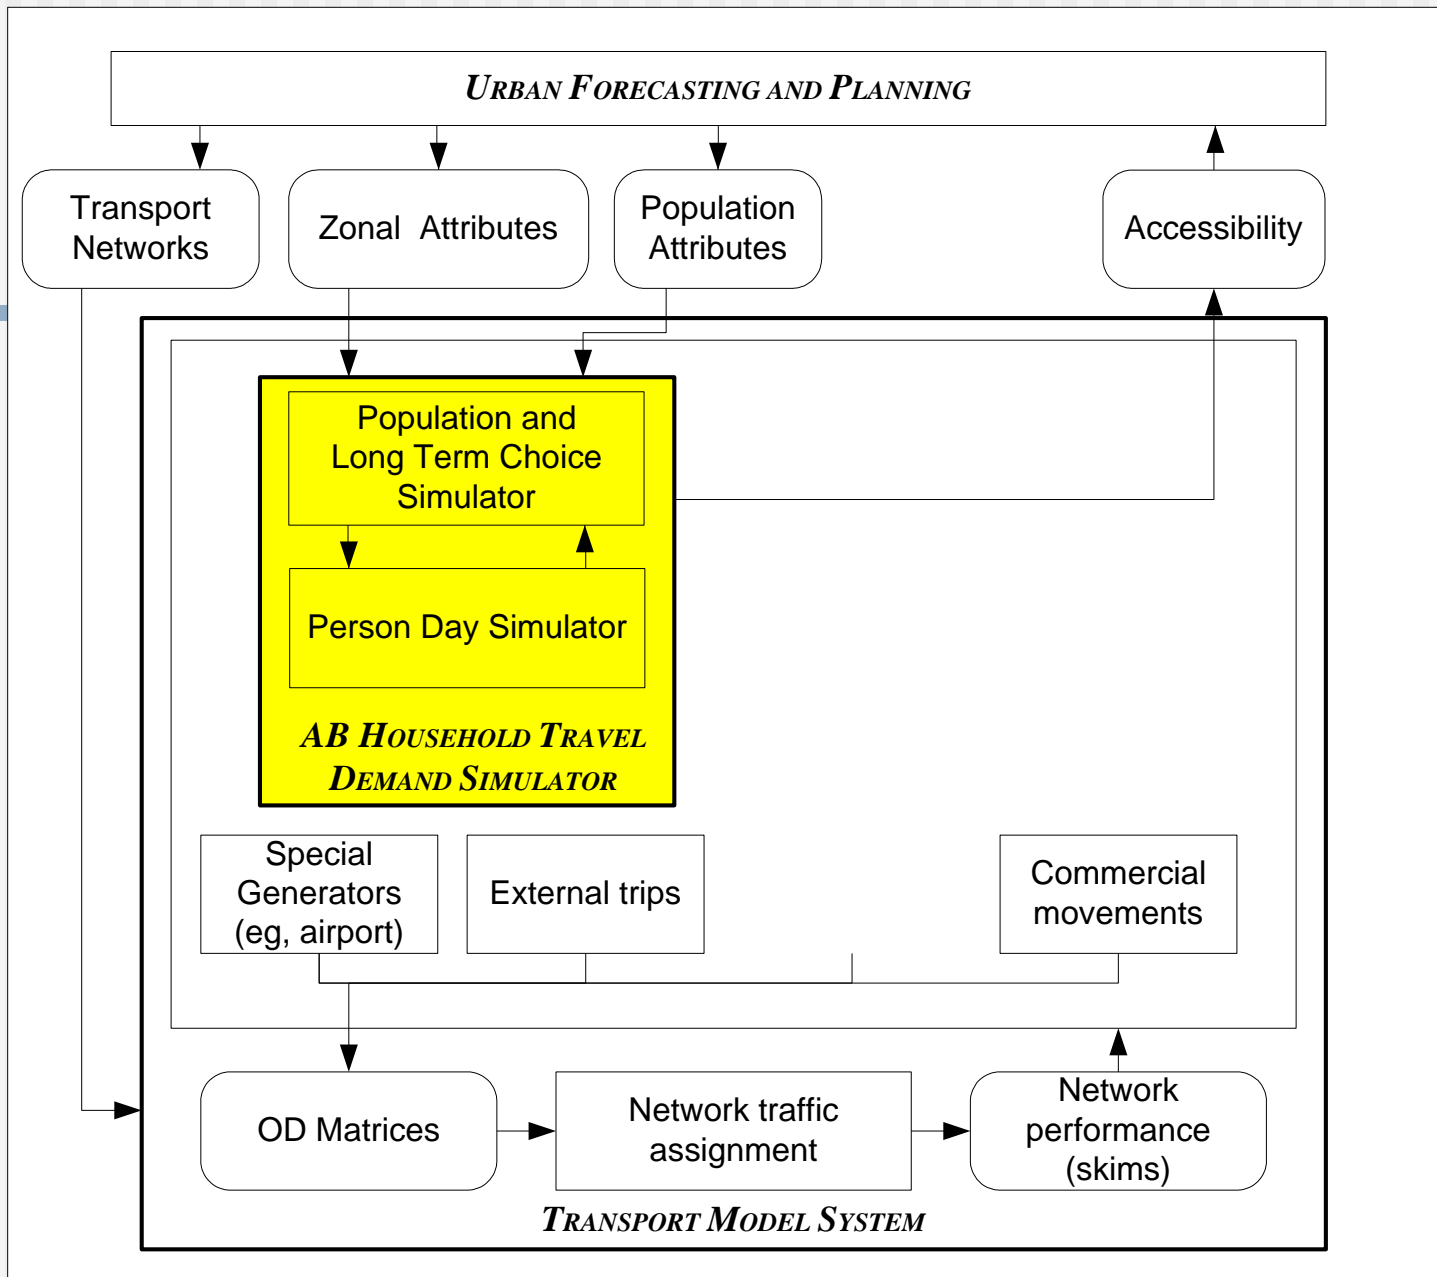

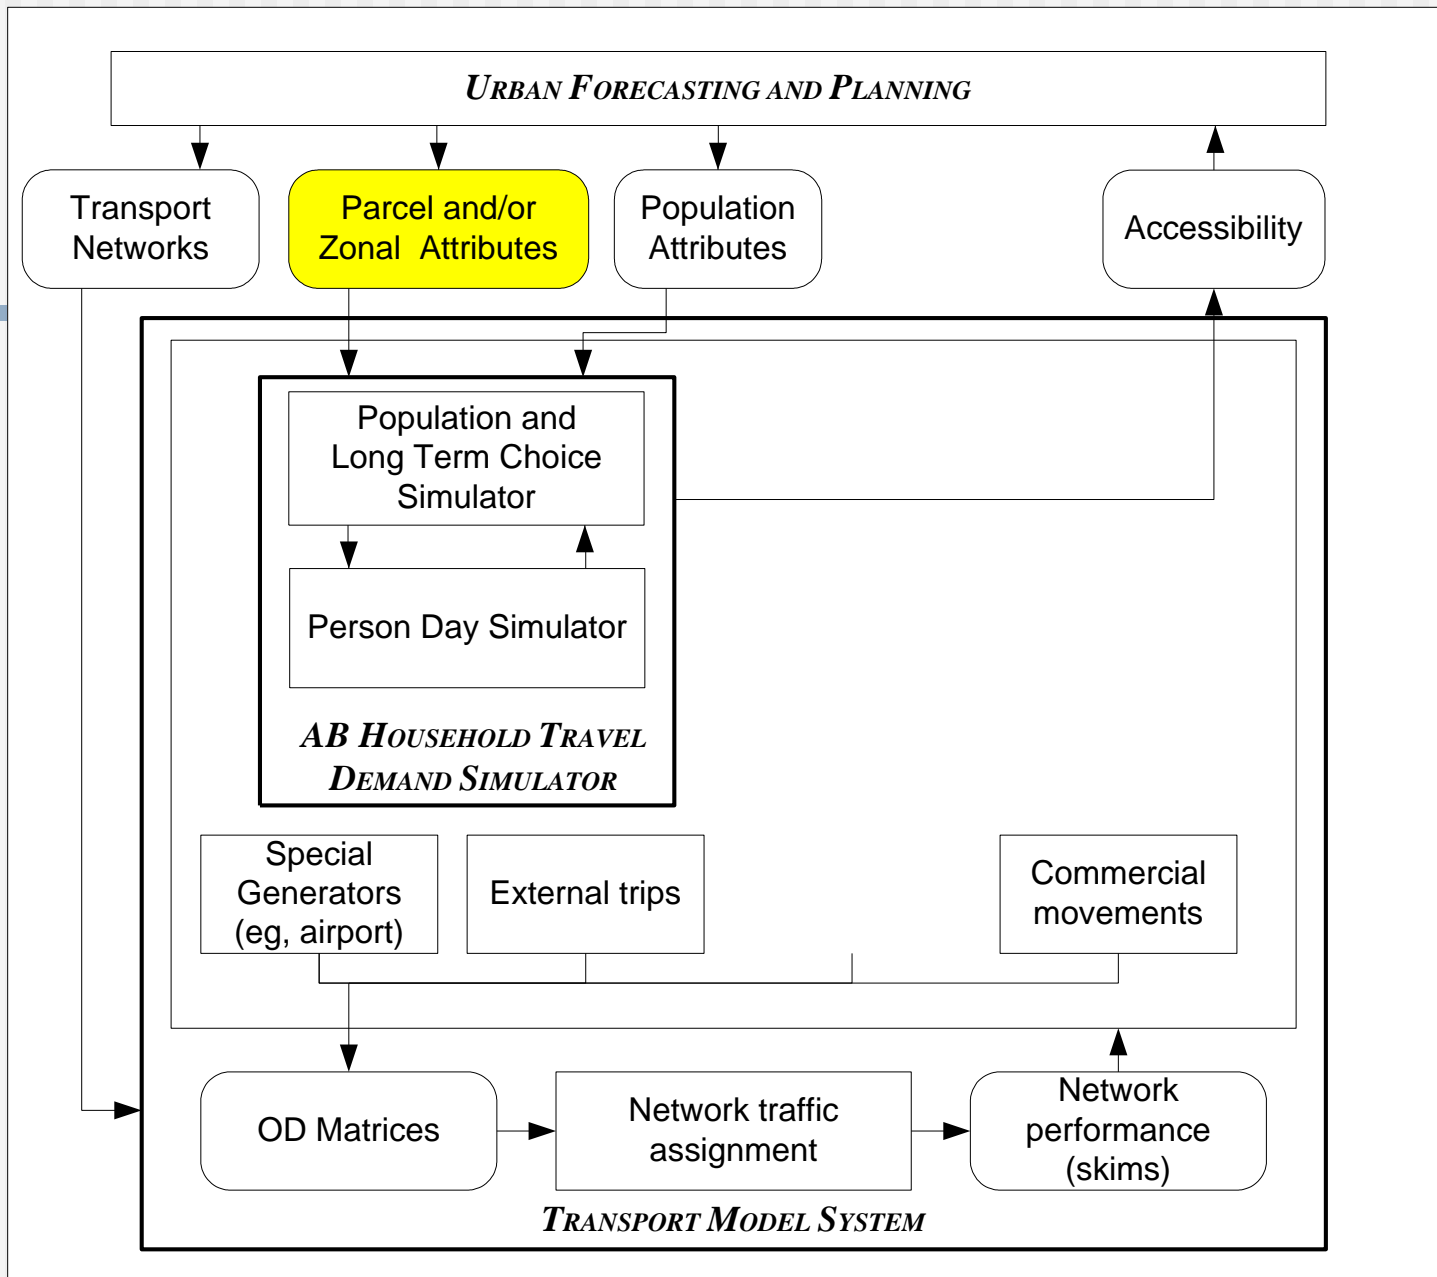

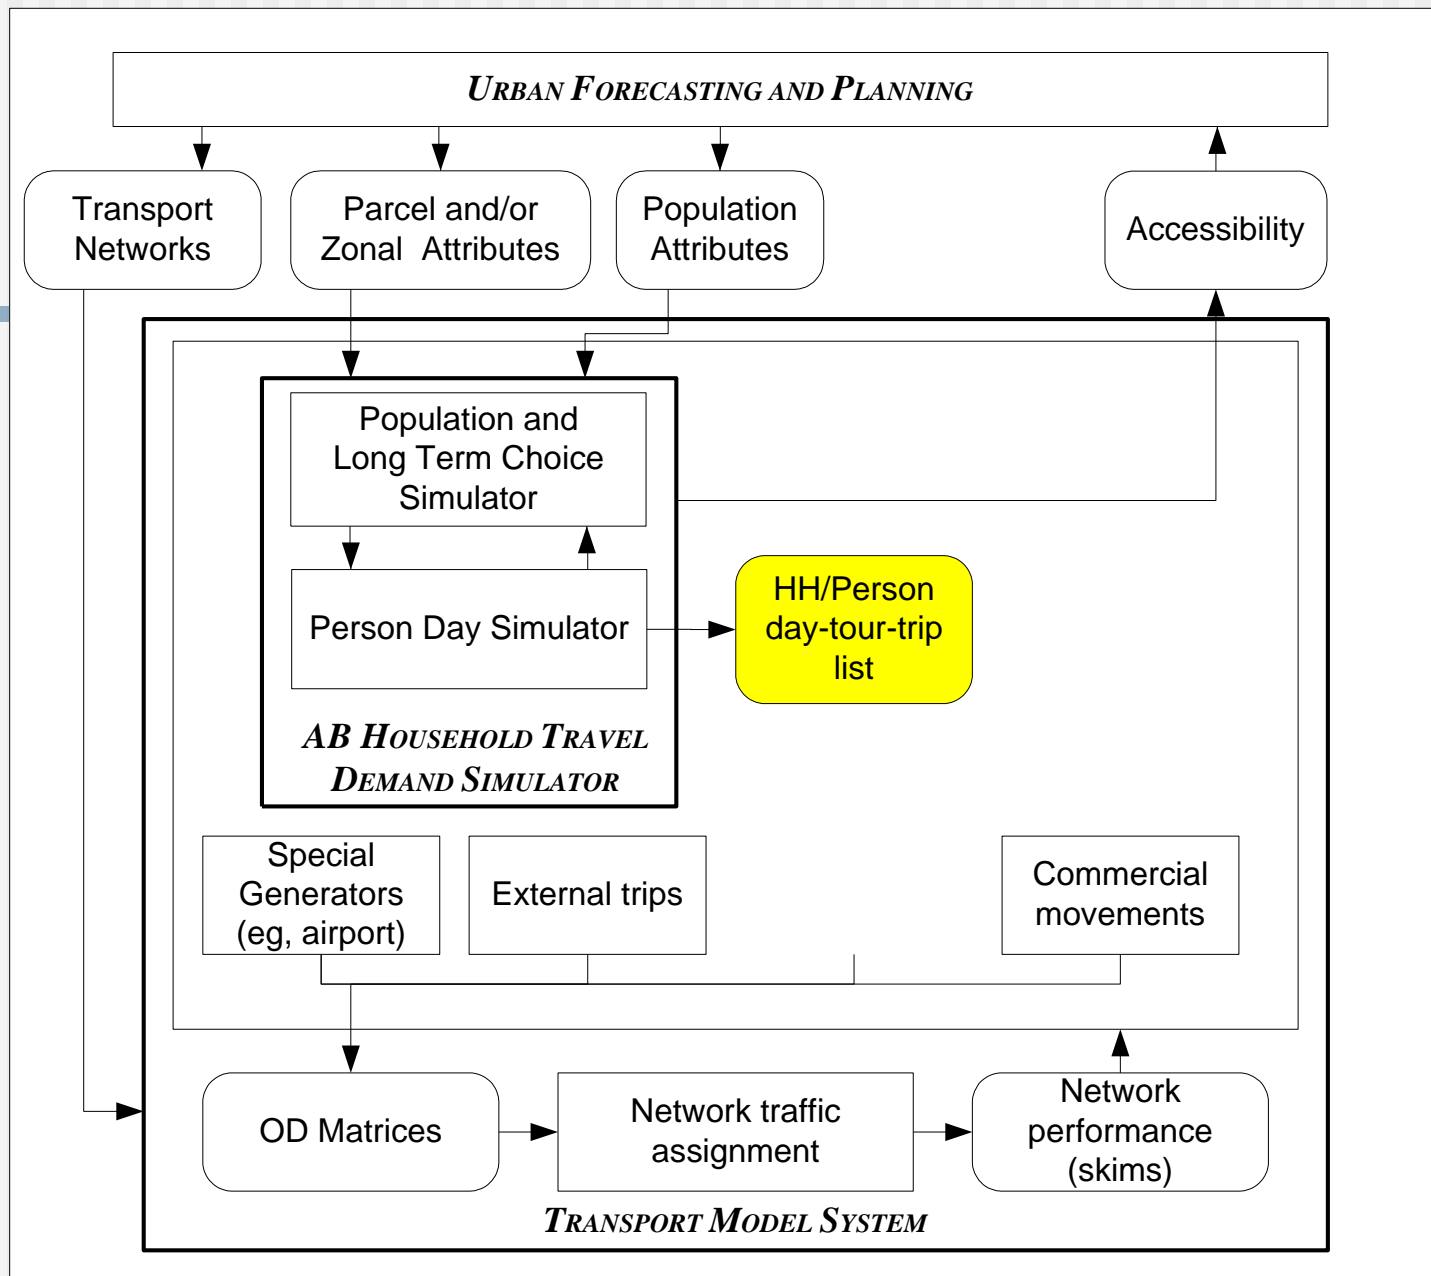

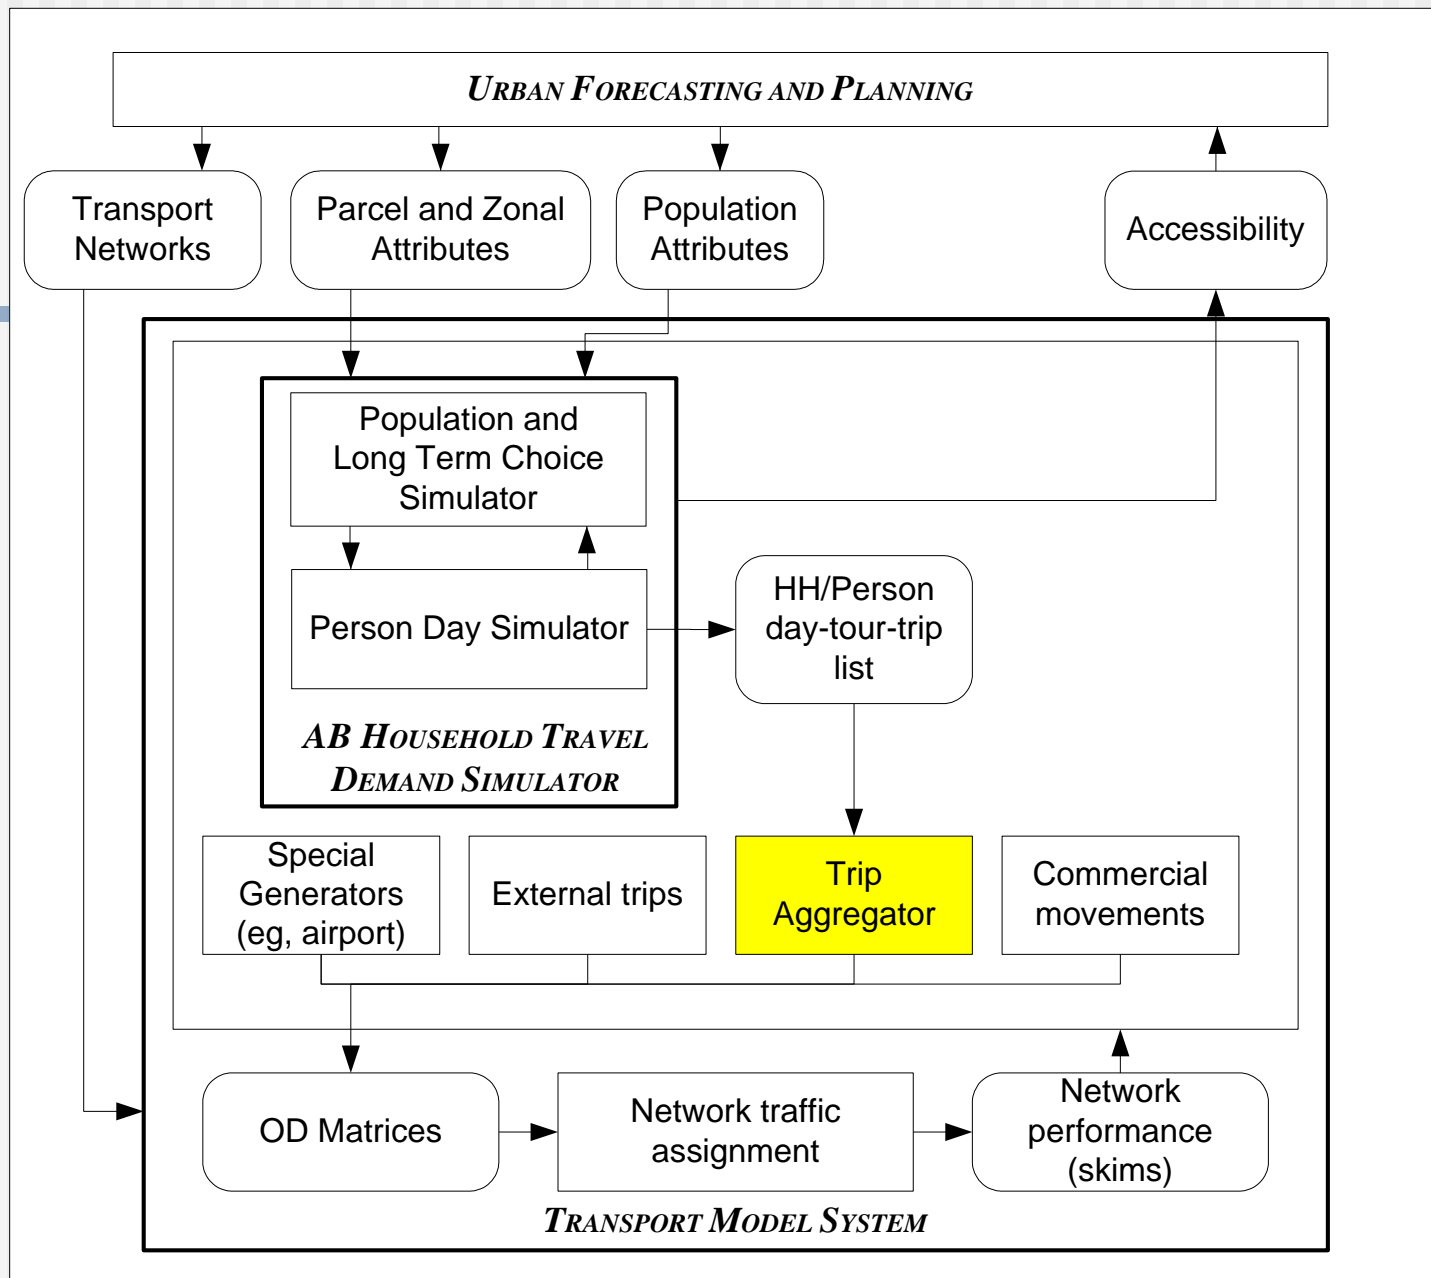

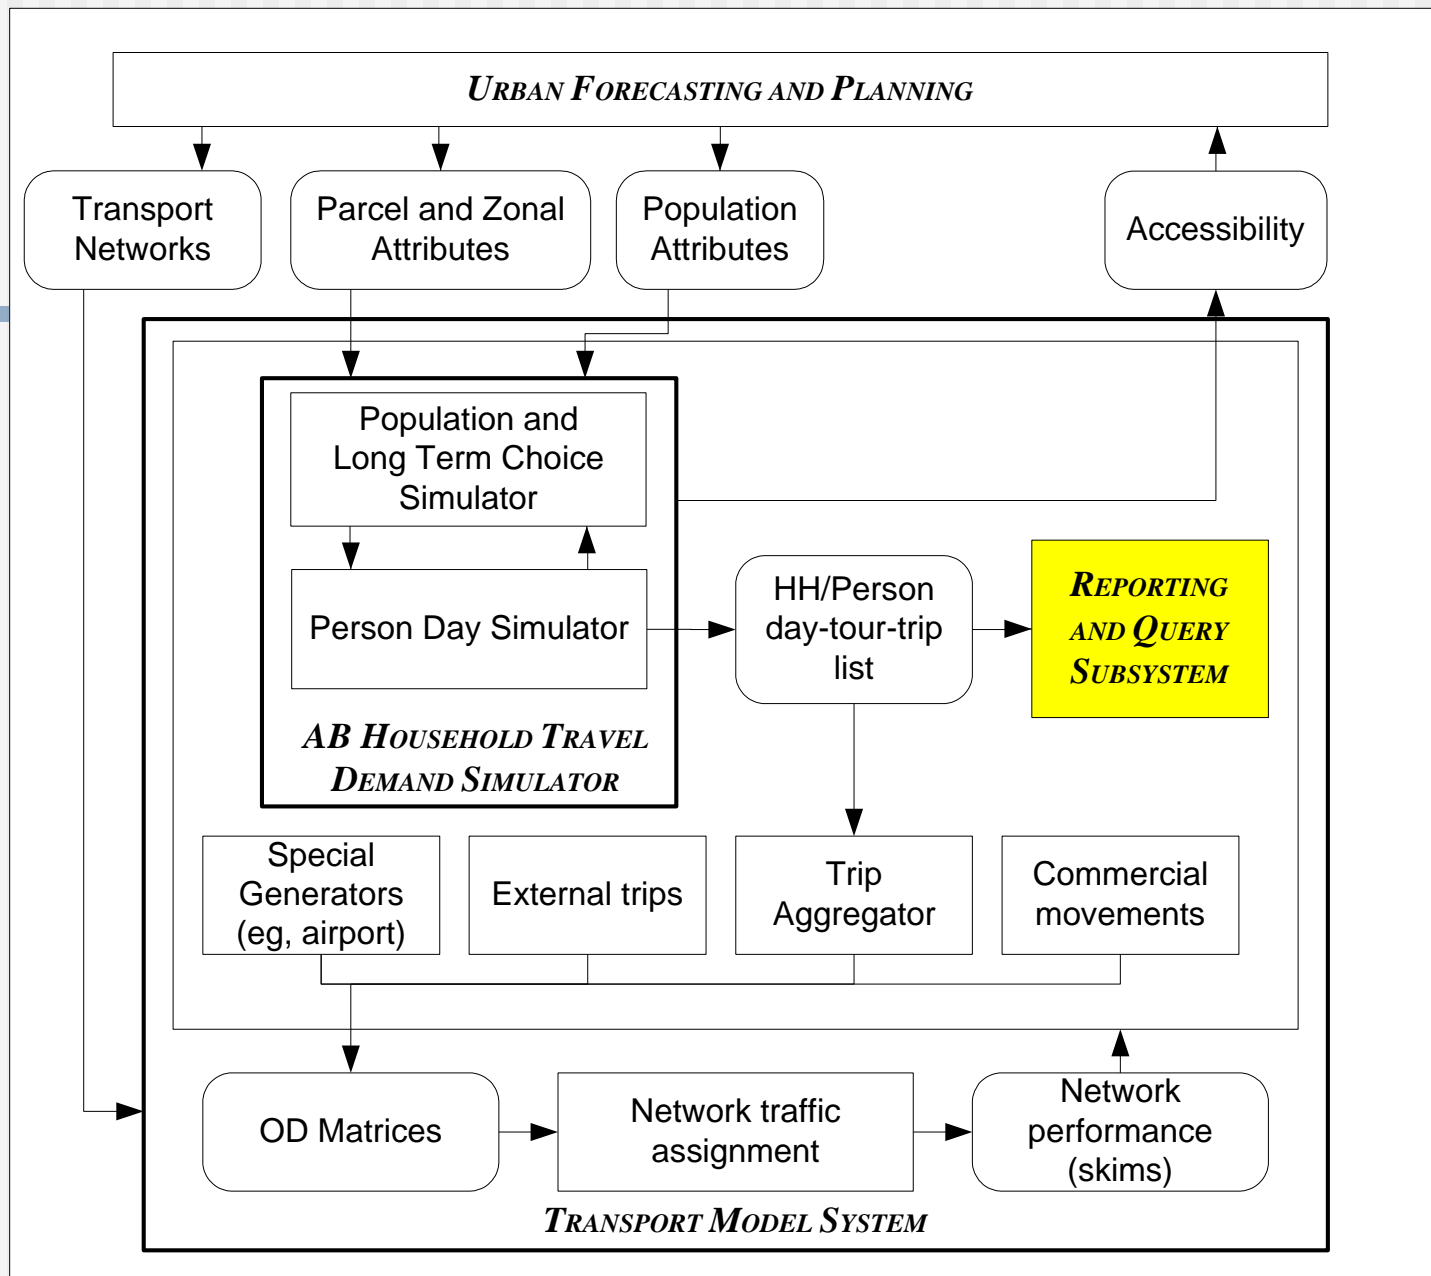

HH/Person/Day/Tour/Trip List

For each...	List includes...
Household	Location, size, vehicles, etc
Person	Age, gender, usual work & school locations, etc
Day	Number of tours and stops
Tour	Purpose, destination, timing, main mode, number of stops
Trip	Origin, destination, origin purpose, destination purpose, mode, departure time, travel time

AB Travel Demand Simulator

Integrated System of Choice Models

DaySim v1.7 Individual Simulation Flowchart

Logit Choice Models

$$P_n(i) = \frac{\exp(\beta'X_{in})}{\sum_j \exp(\beta'X_{jn})}$$

Where i and j index discrete alternatives

$P_n(i)$ is the probability that person n chooses alternative i

X_{in} is a vector of explanatory variables

β is a vector of coefficients

DaySim v1.7 Individual Simulation Flowchart

AB Model Integration

- Downward (conditionality)
- Upward (accessibility)

Downward Integration

Lower models take upper outcomes as given

Downward Integration

Lower models take upper outcomes as given

Downward Integration

Lower models take upper outcomes as given

Downward Integration

Lower models take upper outcomes as given

Upward Integration

Upper models should be sensitive to conditions affecting lower models

Upward Integration

Upper models should be sensitive to conditions affecting lower models

Upward Integration

Upper models should be sensitive to conditions affecting lower models

Upward Integration

Upper models should be sensitive to conditions affecting lower models

Upward Integration

Upper models should be sensitive to conditions affecting lower models

Activity-Based Models

1993-2012

- Early history in the U.S.
- Basics of the “Activity-Based” model systems
- **Advanced features**

Advanced Features

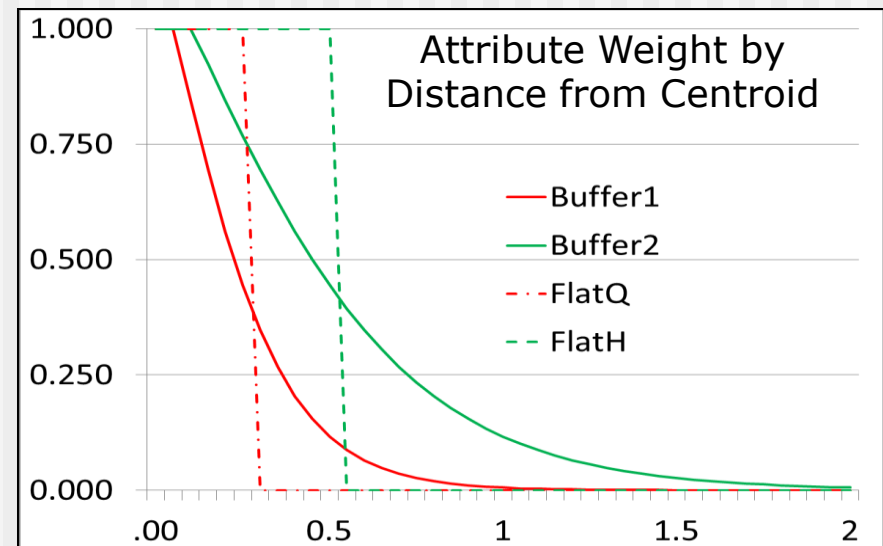

- **Fine spatial scale**
- Sensitivity to pricing
- Household behavior
- Vehicles and parking

Disaggregating Location— 750,000 parcels

Parcel Data: Buffers

- Measure attributes in neighborhood of parcel centroid
 - $\frac{1}{2}$ mi & $\frac{1}{4}$ mile “cliff” buffers (Classic)
 - Decay weighting function (Enhanced)
- Attributes buffered
 - Housing units
 - Employment by sector
 - Enrollment
 - Street intersections by type (dead end, 3-way, 4-way)

Size and neighborhood effects in location choice

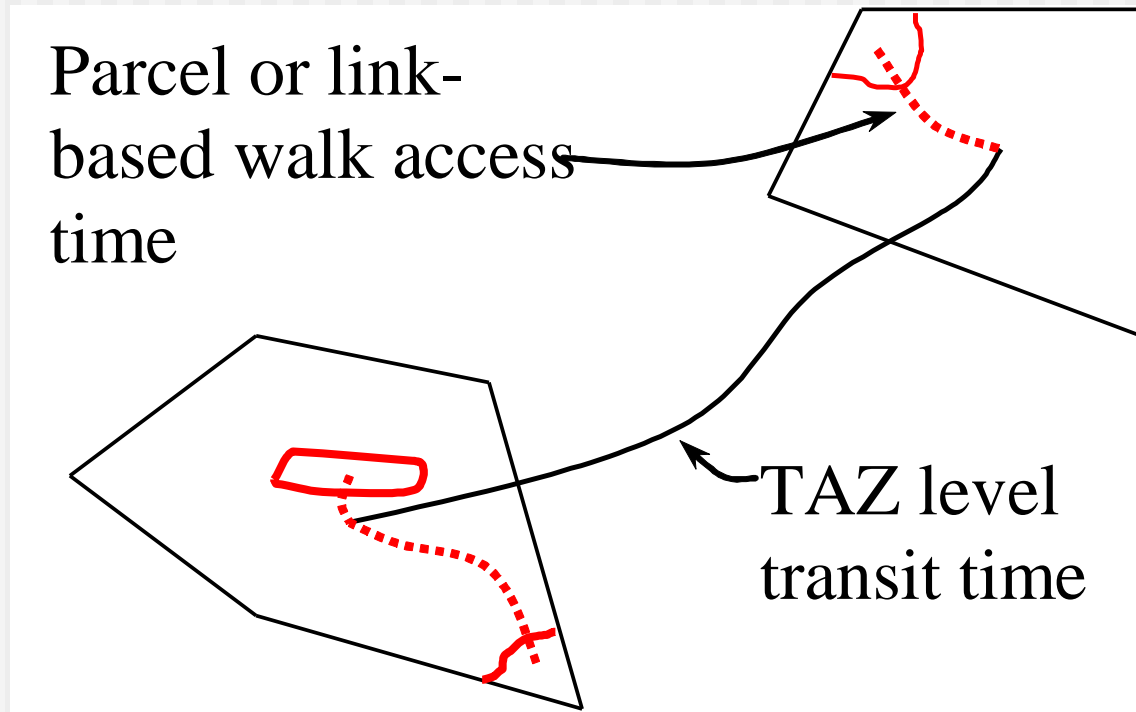

Intermediate Stop Location Model

Escort purpose, Household with kids (PSRC)

Attribute	Parcel size effect relative to base	Neighborhood effect (coefficient)
total employment	0.2563	
K-12 enrollment	1.0000	0.063840
# households	Tiny	
indust.+agr+res.+constr employment		-0.201894

Fine spatial scale

Improving measurement of impedance for transit trips...

Note: assumes person uses nearest transit stop

...improves work mode choice estimation results (and prediction)

	TAZ-based		Link-based	
Log-likelihood	-4637		-4607	
<u>Values of time</u>	<u>\$/hr</u>	<u>(T)</u>	<u>\$/hr</u>	<u>(T)</u>
Car- drive alone	2.2	(1.2)	4.6	(2.5)
Transit- in vehicle	1.4	(1.4)	1.9	(1.9)
Transit- wait	5.9	(3.5)	5.3	(3.3)
Transit- walk	0.9	(0.2)	12.2	(6.1)

From Portland Metro (Bowman, et al, 2001)

Further improvement

(Philadelphia)

- Transit impedance from boarding stop to alighting stop
- Requires stop-to-stop transit skim capability
- AB model chooses stop pair with best total path impedance (including walk access time)

Short distance calculations

Nearest all-streets
network node

Origin
parcel

Skim the distance on the all-
streets network for all
network nodes within X
miles of each other

Nearest all-streets
network node

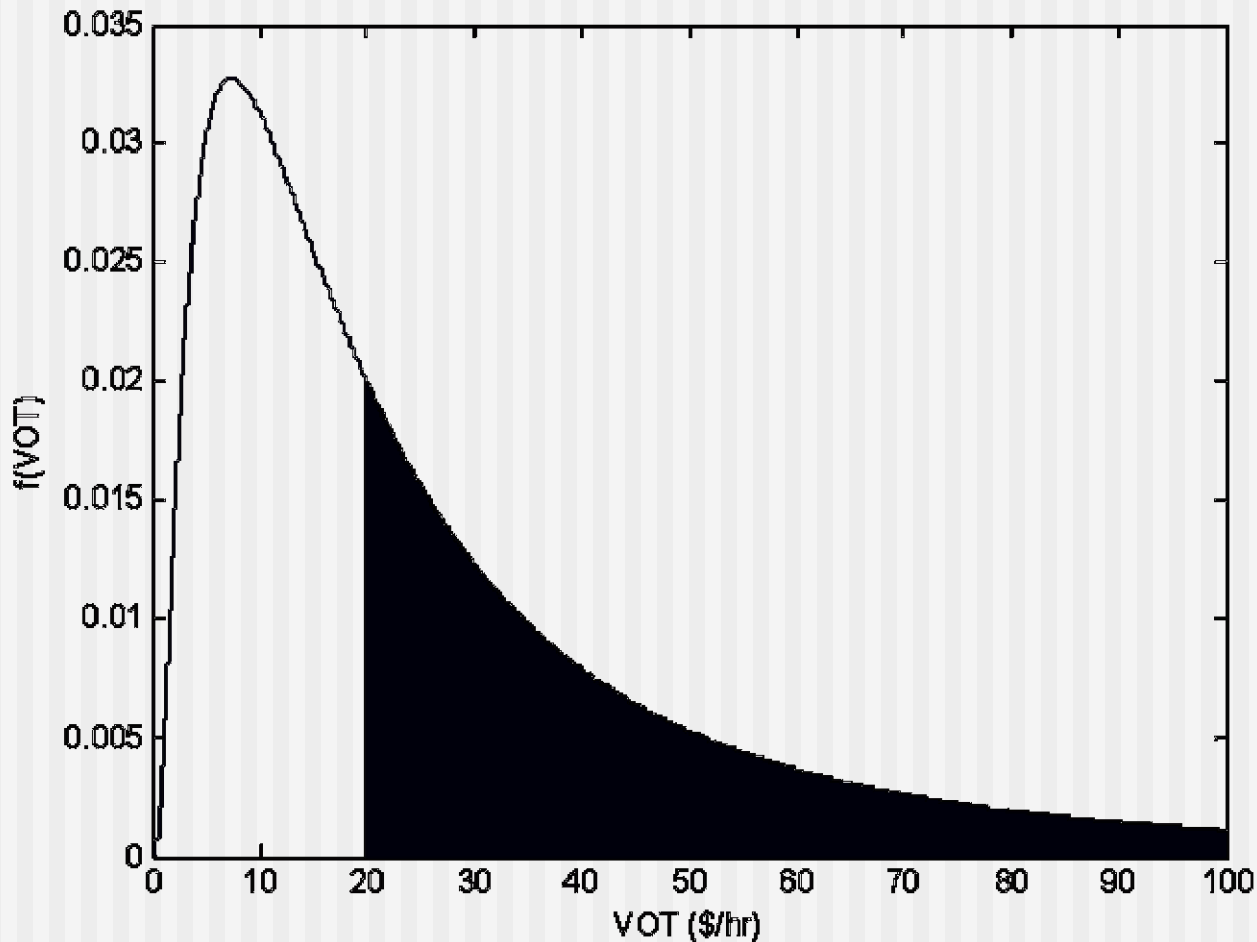

Destination
parcel

- Use for:
 - Walk access to transit
 - Distance on all short trips
 - Adjusting TAZ-based travel times by all modes

Advanced Features

- Fine spatial scale
- **Sensitivity to pricing**
- Household behavior
- Vehicles and parking

Shape of Log-Normal Distribution

Sensitivity to pricing via auto path type choice

(uses findings of SHRP 2 C04 and C10)

In AB model, for each auto trip simulate VOT-dependent binary choice between path with toll and path without toll

- VOT: lognormally distributed function of purpose & income
- Uses skimmed impedance matrices for each combination of:

Time period: 5 to 15 periods

Path type: (1) full network, (2) network excluding tolled links

VOT class: V1, V2, ... VN

Occupancy: (1) SOV, (2) HOV 2 (3) HOV 3+ (if necessary)

VOT variation with income – various C04 data sets

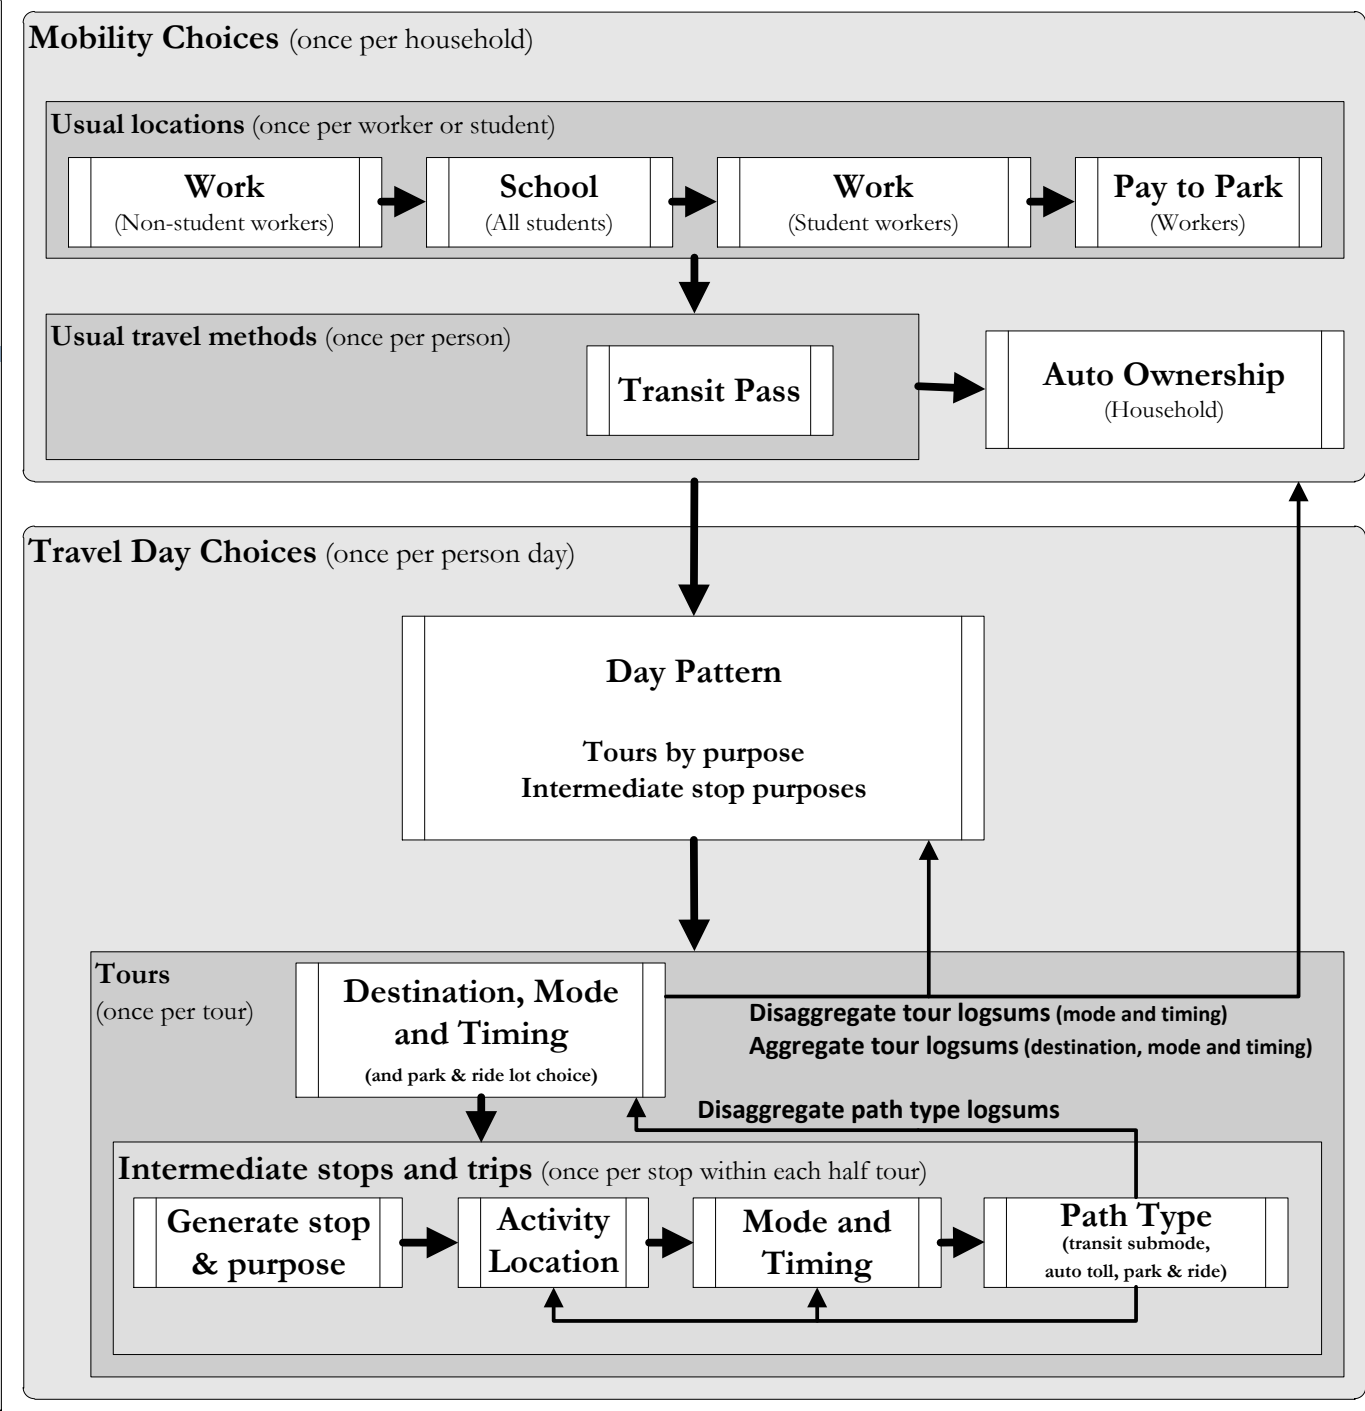

Advanced Features

- Fine spatial scale
- Sensitivity to pricing
- **Household behavior**
- Vehicles and parking

Intra-household models

- Household day pattern
 - work, school, other or home for each member
- Joint tours
- Chauffeur half-tours—take passenger to/from school or work
 - on way to/from work
 - as a 'serve passenger' tour

DaySim v1.7 Individual Simulation Flowchart

DaySim v2.0 Household Simulation Flowchart

Mobility Choices (once per household)

Usual locations (once per worker or student)

Usual travel methods (once per person)

Travel Day Choices (once per household day)

Household Day Pattern

1. Choice of work, non-work or at-home day (modeled jointly for all persons in HH)
2. Work and school tours (workers and students)
 - a. tour and subtour generation
 - b. half-tour travel coordination among workers and students
3. Fully joint tour generation and participation
4. Individual tour pattern and stop purpose generation (once per person)

Tours (once per tour)

Intermediate stops and trips (once per stop within each half tour)

Disaggregate path type logsums

Disaggregate tour logsums (mode and timing)
Aggregate tour logsums (destination, mode and timing)

Advanced Features

- Fine spatial scale
- Sensitivity to pricing
- Household behavior
- **Vehicles and parking**

Park and ride lot location choice

- Lot utility depends on impedance from O to D via lot
- Simulator accounts for lot fill levels by time of day
- Lot is not available if it is full when trip would arrive.

More vehicle model possibilities

- vehicle type choice
- vehicle usage
- vehicle itinerary accounting

More possibilities

In the queue and around the corner

- Effects of reliability
- Tour-based commercial movements
- Activity-based visitor models
- Integration with dynamic traffic assignment
