# Build Sensor Tree

1. The `conns` field of `sensing_sensor` and the `source` field of `sensing_connection` were assigned basing on the DTS configuration at compile time.  
The DTS parser also sorted the sensors by device's dependence relationship.
2. In sensing sensor's init function, the sensor which has the reporter sensors can get the handles for its reporters for future use by calling [`sensing\_sensor\_get\_reporters\(\)`](#).

# Sensing runtime process

# Demo code
